Problem 1: (35 points)[Oxtoby problem 8.1711.00 moles of
hydrogen gas, $\mathrm{H}_{2}$, ( $\mathrm{C}_{\mathrm{p}}=28.8 \mathrm{~J} / \mathrm{K}$-mole) is expanded reversibly and isothermally at 400 K from an initial volume of 12.0 L to a final volume of 30.0 L.
a)(5 points) Calculate the change in energy $\Delta \mathrm{E}$ for the gas. Show all reasoning clearly.

## Treat hydrogen as an ideal gas.

Change is carried out isothermally, $T=$ constant
E for an ideal gas depends only on temperature
Therefore, $\Delta E=0$, since $T$ does not change
b)(5 points) Calculate the change in enthalpy $\Delta \mathrm{H}$ for the gas. Show all reasoning clearly.
$\Delta H=\Delta E+\Delta(P V)$
But PV $=$ nRT, with $n, R$, and $T$ constant
Therefore, $\Delta(P V)=\Delta(n R T)=0$
$\Delta E=0$ (part a).
$\Delta H=0+0=0$
c)(10 points) Calculate w, the work done on the gas for this process. Show all reasoning clearly.
$w=-\int p_{e x t} d V$
However, process is carried out reversibly, so
$p_{\text {ext }}=p=n R T / V$
$w=-\int p d V=-\int(n R T / V) d V$
Since $n, R, T$ are constant, $w=-n R T \int(d V / V)$
$w=-n R T \ln \left(V_{f} / V_{i}\right)$
$n=4$ moles, $R=8.314 \mathrm{~J}$ oules/ mole-deg, $T=400 \mathrm{deg}$,
$V_{f}=30 L, V_{i}=12 L$
$w=-(4)(8.314)(400) \ln (30 / 12)$
$w=-12,189$ Joules

Print your name here:
d)(5 points) Calculate $q$, the heat absorbed by the gas for this process. Show all reasoning clearly.
$\Delta E=\mathbf{q}+\mathbf{w}$
However, $\Delta E=0$ (part a)
Thus, $q=-w$
From part $c,-w=12,189$ Joules q=12,189 Joules
e)(10 points) Calculate the change in entropy $\Delta \mathrm{S}$ for the gas. Show all reasoning clearly.

$$
\Delta S=\int\left(\text { dqrev }_{\text {rev }} / T\right)
$$

But process is isothermal, $T=$ constant, so
$\Delta S=(1 / T) \int d q_{r e v}$
$\Delta S=(1 / T)$ qrev
From part d, qrev $=12,189 \mathrm{Joules}$ and $T=400 \mathrm{~K}$ is given
$\Delta S=(12,189 \mathrm{Joules} / 400 \mathrm{deg})$
$\Delta S=30.47 \mathrm{Joules} / \mathrm{deg}$

## Print your name here:

Problem 2: (35 points) Consider the very important chemical transformation (one at the heart of the alternate fuels industry):

$$
\mathrm{H}_{2} \mathrm{O}(\mathrm{~g})+\mathrm{CO}(\mathrm{~g})=\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})
$$

and the data:

|  | $\Delta H^{\circ}{ }_{\text {f }}\left(25^{\circ} \mathrm{C}\right)$ | $\mathbf{S}^{\circ}\left(25^{\circ} \mathrm{C}\right)$ | $\Delta G^{\circ}{ }_{\text {f }}\left(25^{\circ} \mathrm{C}\right)$ | $\mathrm{C}_{\mathrm{p}}\left(25^{\circ} \mathrm{C}\right)$ |
| :---: | :---: | :---: | :---: | :---: |
|  | (kJ/mole) | (J/K ${ }^{\circ} \mathrm{mole}$ ) | (kJ/mole) | (J/ K ${ }^{\circ} \mathrm{mole}$ |
| CO(g) | -110.5 | 197.6 | -137.2 | 29.14 |
| $\mathrm{CO}_{2}(\mathrm{~g})$ | -393.5 | 213.6 | -394.4 | 37.11 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | -241.8 |  | -228.6 | 35.58 |
| $\mathrm{H}_{2}(\mathrm{~g})$ |  | 130.6 |  | 28.82 |

a)(5 points) Calculate $\Delta \mathrm{H}^{\circ} 298$ for this reaction. Show all reasoning clearly.

$\Delta H^{\circ}{ }_{f}\left(\mathrm{H}_{\mathbf{2}}\right)=0$ by definition
$\Delta H^{\circ}{ }_{298}=(-393.5)+(0)-(-110.5)-(-241.8) \mathrm{kJ}$
$\Delta H^{\circ}{ }_{298}=-41.2 \mathrm{kJoules}$
b)(5 points) Calculate $\Delta G^{\circ}{ }_{298}$ for this reaction. Show all reasoning clearly.

$$
\begin{aligned}
& \Delta G^{\circ}{ }_{298}=\Delta G^{\circ}{ }_{f}\left(\mathrm{CO}_{2}\right)+\Delta G^{\circ}{ }_{f}\left(\mathrm{H}_{2}\right)-\Delta \mathbf{G}_{\mathrm{f}}^{\circ}(\mathrm{CO})-\Delta \mathbf{G}_{\mathrm{f}}{ }_{\mathrm{f}}\left(\mathrm{H}_{2} \mathrm{O}\right) \\
& \Delta \mathbf{G}_{\mathrm{f}}^{\circ}\left(\mathrm{H}_{2}\right)=0 \text { by definition } \\
& \Delta \mathbf{G}^{\circ}{ }_{298}=(-394.4)+(0)-(-137.2)-(-228.6) \mathrm{kJ} \\
& \Delta G^{\circ}{ }_{298}=-28.6 \mathrm{~kJ} \text { oules }
\end{aligned}
$$

Print your name here:
c)(5 points) Calculate $\Delta \mathrm{S}^{\circ}{ }_{298}$ for this reaction. Show all reasoning clearly.
$\Delta \mathbf{G}^{\circ}{ }_{298}=\Delta H^{\circ}{ }_{298}-\mathbf{T} \Delta S^{\circ}{ }_{298}$
$\left(\Delta \mathbf{G}^{\circ} 298-\Delta \mathbf{H}^{\circ}{ }_{298}\right) / \mathbf{T}=-\Delta \mathbf{S}^{\circ} 298$
$\Delta S^{\circ}{ }_{298}=\left(\Delta H^{\circ}{ }_{298}-\Delta G^{\circ}{ }_{298}\right) / T$
$\Delta H^{\circ}{ }_{298}$ from part a and $\Delta G^{\circ}{ }_{298}$ from part b
$\Delta S^{\circ}{ }_{298}=[-41.2-(-28.6)] / 298 \mathrm{kJoules} / \mathrm{deg}$
$\Delta S^{\circ}{ }_{298}=-42.3 \mathrm{Joules} / \mathrm{deg}$
d)(10 points) Assuming all the gases involved in this reaction are ideal gases, calculate $\Delta \mathrm{E}^{\circ}{ }_{298}$ for this reaction. Show all reasoning clearly.
$\Delta H^{\circ}{ }_{298}=\Delta E^{\circ}{ }_{298}+\Delta(P V)$
But, $\Delta(P V)=\Delta(n R T)$, with $R$ const and $T=298 \mathrm{~K}$ also const.
So $\Delta(P V)=R T \Delta(n)$, where $\Delta n$ is the change in the number of moles of gas resulting from reaction.
$\Delta n=1+1-1-1=0$
So $\Delta(P V)=0$ and
$\Delta H^{\circ}{ }_{298}=\Delta E^{\circ}{ }_{298}$
$\Delta E^{\circ} 298=\Delta H^{\circ}{ }_{298}=-41.2 \mathrm{kJoules}$ (from part a)
e)( 10 points) Compute the absolute entropy $\left[\mathrm{S}^{\circ}{ }_{298}\right.$ ] for $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ at 298 K . Show all reasoning clearly.
$\Delta S^{\circ}=-42.3 \mathrm{Joules} /$ deg from part c
But, $\Delta S^{\circ}=S^{\circ}{ }_{298}\left(C_{2}\right)+\mathbf{S}_{298}^{\circ}\left(\mathrm{H}_{2}\right)-\mathrm{S}^{\circ}{ }_{298}(\mathrm{CO})-\mathrm{S}_{298}^{\circ}\left(\mathrm{H}_{2} \mathrm{O}\right)$
All $S^{\circ}{ }_{298}$ given except for $S_{298}\left(H_{2} \mathrm{O}\right)$
-42.3 Joules/ deg $=213.6+130.6-197.6-S_{98}\left(H_{2} \mathbf{O}\right)$
42.3 Joules/ deg + $213.6+130.6-197.6=\mathrm{S}_{98}\left(\mathrm{H}_{2} \mathrm{O}\right)$
$\mathrm{S}^{\circ}{ }_{298}\left(\mathrm{H}_{2} \mathrm{O}\right)=188.9 \mathrm{Joules} / \mathrm{deg}$

## Print your name here:

Problem 3: ( 30 Points)The conversion of liquid ethanol, $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}$, to ethanol vapor may be thought of as a chemical reaction carried out at a specific temperature T :

$$
\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} \text { (liquid) }=\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH} \text { (vapor) }
$$

The following thermodynamic data for liquid and gaseous ethanol may be useful in answering the following questions:

|  | $\Delta H^{\circ}{ }_{f}\left(25^{\circ} \mathrm{C}\right)$ | $\mathrm{S}^{\circ}\left(25^{\circ} \mathrm{C}\right)$ | $\Delta \mathrm{G}^{\circ} \mathrm{f}$ (25 $\left.{ }^{\circ} \mathrm{C}\right)$ | $\mathrm{C}_{\mathrm{p}}\left(25^{\circ} \mathrm{C}\right)$ |
| :---: | :---: | :---: | :---: | :---: |
|  | (kJ/mole) | (J/K${ }^{\circ} \mathrm{mole}$ ) | (kJ/mole) | (J/ K ${ }^{\circ} \mathrm{mole}$ |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{g})$ | -235.10 | 282.59 | -168.57 | 65.44 |
| $\mathrm{CH}_{3} \mathrm{CH}_{2} \mathbf{O H}(\mathrm{I})$ | -277.69 | 160.7 | -174.89 | 111.46 |

a) ( $\mathbf{5}$ points) Calculate $\Delta \mathrm{H}$ for the conversion of one mole of ethanol liquid to ethanol vapor at a pressure of one atmosphere and $\mathrm{T}=25^{\circ} \mathrm{C}$. Show all reasoning clearly.
$\Delta H=\Delta H^{\circ}=\Delta H^{\circ}{ }_{f}\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathbf{O H}(\mathrm{~g})\right)-\Delta \mathrm{H}^{\circ}{ }_{\mathrm{f}}\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathbf{O H}(\mathrm{I})\right)$
$\Delta H=-235.10-(-277.69) \mathrm{kJoules}$
$\Delta H=42.59 \mathrm{kJoules}$
b)(5 points) Calculate $\Delta \mathrm{S}$ for the conversion of one mole of ethanol liquid to ethanol vapor at a pressure of one atmosphere and $\mathrm{T}=25^{\circ} \mathrm{C}$. Show all reasoning clearly.

$$
\begin{aligned}
& \Delta S=\Delta S^{\circ}=\mathrm{S}^{\circ}{ }_{298}\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{~g})\right)-\mathrm{S}^{\circ}{ }_{298}\left(\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{OH}(\mathrm{I})\right) \\
& \Delta \mathrm{S}=282.59-160.7 \mathrm{Joules} / \mathrm{deg} \\
& \Delta \mathrm{~S}=121.89 \mathrm{Joules} / \mathrm{deg}
\end{aligned}
$$

## Print your name here:

c)(5 points) Assuming that both $\Delta \mathrm{S}$ and $\Delta \mathrm{H}$ are independent of temperature, calculate the normal boiling point temperature for ethanol. Show all reasoning clearly.

At Thoiling $_{\text {b }}, \Delta \mathbf{G}^{\circ}=\Delta H^{\circ}-\mathbf{T}_{\mathbf{B}} \Delta \mathbf{S}^{\circ}=\mathbf{0}$
$\Delta \mathbf{H}^{\circ}=\mathbf{T}_{\mathbf{B}} \Delta \mathbf{S}^{\circ}$
$T_{B}=\Delta H^{\circ} / \Delta \mathbf{S}^{\circ}$
$\Delta H^{\circ}$ from part a and $\Delta S^{\circ}$ from part b
$T_{B}=42,590 \mathrm{Joules} /(121.89 \mathrm{Joules} / \mathrm{deg})$
$T_{B}=349.4 K$
d)(15 points) If the chemical potential (Free Energy per mole) of liquid ethanol is independent of pressure, $\left[\mu_{\mathrm{iq}}(\mathrm{T}, \mathrm{p})=\mu_{\mathrm{liq}}{ }^{\circ}(\mathrm{T})\right.$, all pressures] and the chemical potential of ethanol vapor is that of an ideal gas, $\left[\mu_{\mathrm{vap}}(T, p)=\right.$ $\mu_{\text {vap }}{ }^{\circ}(T)+R T \ln \left(p_{v a p}\right)$, where $p_{\text {vap }}$ is the pressure of the gaseous ethanol], what is the pressure of ethanol vapor when ethanol vapor is in equilibrium with ethanol liquid at 298 K ? Show all reasoning clearly.
$\Delta G$ for this process is the same as $\Delta \mu$ since $\mu$ is simply $G$ for one mole of substance.

$$
\begin{aligned}
& \Delta \mathbf{G}=\mu_{\mathbf{v a p}}(\mathbf{T}, \mathbf{p})-\mu_{\mathrm{Iq}}(\mathbf{T}, \mathbf{p}) \\
& \mu_{\mathbf{v a p}}(T, p)-\mu_{\mathbf{i q}}(T, p)=\mu_{\mathbf{v a p}}{ }^{\circ}(T)+R T \operatorname{In}\left(p_{\text {vap }}\right)-\mu_{\mathrm{liq}}{ }^{\circ}(T) \\
& \Delta G=\mu_{\mathbf{v a p}}{ }^{\circ}(T)-\mu_{\mathrm{Iq}}{ }^{\circ}(T)+R T \operatorname{In}\left(p_{\text {vap }}\right) \\
& \mu_{\text {vap }}{ }^{\circ}(\mathbf{T}=298)-\mu_{1 i q}{ }^{\circ}\left(\mathbf{T}=\mathbf{2 9 8 )}=\Delta \mathbf{G}_{298}{ }^{\circ}\right. \\
& \Delta G=\Delta \mathbf{G}_{298}{ }^{\circ}+R T \operatorname{In}\left(p_{\text {vap }}\right)
\end{aligned}
$$

But, at equilibrium, $\Delta G=0$ and $p_{\text {vap }}=p_{\text {eq }}$
So $\Delta \mathbf{G}_{298}{ }^{\circ}=-R T \ln \left(p_{\text {eq }}\right)$
$\Delta \mathbf{G}_{298}{ }^{\circ}=-168.57-(-174.89) \mathrm{kJoules}$
$\Delta \mathbf{G}_{298}{ }^{\circ}=+6.32 \mathrm{kJoules}$
$\ln \left(P_{\text {eq }}\right)=-6320 /(8.314)(298)$
$p_{\text {eq }}=0.078$ atm (59.3 Torr)

## Print your name here:

Problem 4: (50 points) [A sibling of Oxtoby, 8.19 Water can be supercooled reversibly below its freezing point of $0^{\circ} \mathrm{C}$ to $-10^{\circ} \mathrm{C}$.
Supercooled water can also be warmed reversibly from $-10^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}$. Once supercooled, however, a slight mechanical shock is sufficient to convert supercooled liquid water to solid ice irreversibly and isothermally at $-10^{\circ} \mathrm{C}$. The molar enthalpy of fusion for converting solid ice to liquid water at $-10^{\circ} \mathrm{C}$ is 5649 joules/ mole while the molar enthalpy of fusion for converting solid ice to liquid water at $0^{\circ} \mathrm{C}$ is 6025 joules/ mole. The molar heat capacity of ice (constant pressure, $C_{p}$, independent of temperature) is 37.7 joules/ mole-deg while the molar heat capacity of water (constant pressure, $C_{p}$, independent of temperature) is 75.3 joules/ mole-deg. All of the following manipulations are carried out at a constant pressure of 1 atm
a)(i0 points) Calculate the entropy change when one mole of liquid water, initially at $-10^{\circ} \mathrm{C}$, is warmed reversibly to $0^{\circ} \mathrm{C}$. Show all reasoning clearly.
$\Delta S=\int d q_{r e v} / T$
$d q_{\text {rev }}=C_{p} d T$
$\Delta S=\int\left(C_{p} / T\right) d T$
$C_{p}=$ constant pressure heat capacity of liquid water
$C_{p}=$ constant independent of $T$ (given)
$\Delta S=C_{p} \int(d T / T)$
$\Delta S=C_{p} \ln \left(T_{f} / T_{i}\right)$
$C_{p}=75.3$ joules/ mole-deg, $T_{f}=273, T_{i}=263$ (given)
$\Delta S=[75.3$ joules/ mole-deg] In(273/263)
$\Delta S=[75.3$ joules/ mole-deg] (3.73)10
$\Delta S=2.81$ joules/ mole-deg

## Print your name here:

b)(10 points) Calculate the entropy change when one mole of liquid water initially at $0^{\circ} \mathrm{C}$ is converted isothermally to ice at $0^{\circ} \mathrm{C}$. (In case you have forgotten (!!), $0^{\circ} \mathrm{C}$ is the melting point of ice, defined to be the temperature at which water and ice are in equilibrium with each other.) Show all reasoning clearly.
$\Delta S=\int \mathbf{d} q_{\text {rev }} / T$
Isothermal process, $T=$ constant
$\Delta S=(1 / T) \int d q_{r e v}$
$\Delta S=\left(q_{\mathrm{rev}} / T\right)$
Here $q_{\text {rev }}=-\Delta \mathbf{H}_{\text {fusion }}$
T = 273 (Normal melting point of ice) (given)
$\Delta H_{\text {fusion }}=6025$ joules/ mole
$\Delta S=$ [-6025 joules/ mole]/ 273 deg
$\Delta S=-22.07$ joules/ mole-deg
c)(10 points) Calculate the entropy change when one mole of ice initially at $0^{\circ} \mathrm{C}$ is cooled reversibly to $-10^{\circ} \mathrm{C}$. Show all reasoning clearly.
$\Delta S=\int d_{q_{\text {rev }}} / T$
$d q_{\text {rev }}=C_{p} d T$
$\Delta S=\int\left(C_{p} / T\right) d T$
$C_{p}=$ constant pressure heat capacity of solid water (ice)
$C_{p}=$ constant independent of $T$ (given)
$\Delta S=C_{p} \int(d T / T)$
$\Delta S=C_{p} \ln \left(T_{f} / T_{i}\right)$
$C_{p}=37.7$ joules/mole-deg, $T_{f}=263, T_{i}=273$ (given)
$\Delta S=[37.7$ joules/ mole-deg] $\operatorname{In}(263 / 273)$
$\Delta S=\left[37.7\right.$ joules/ mole-deg] (-3.73) $10^{2}$
$\Delta S=-1.41$ joules/ mole-deg

## Print your name here:

d) (10 points) Calculate the entropy change when one mole of liquid water at $-10^{\circ} \mathrm{C}$ is converted isothermally and irreversibly to ice at $-10^{\circ} \mathrm{C}$. Show all reasoning clearly.

The irreversible path $\mathrm{H}_{2} \mathrm{O}\left(\mathrm{liq},-10^{\circ}\right) \rightarrow \mathrm{H}_{2} \mathrm{O}$ (solid, -10 ${ }^{\circ}$ )
has the same initial and final states as the reversible path $\mathrm{H}_{2} \mathrm{O}\left(\mathrm{liq},-10^{\circ}\right) \rightarrow \mathrm{H}_{2} \mathrm{O}\left(\mathrm{liq}, 0^{\circ}\right) \rightarrow$
$\mathrm{H}_{2} \mathrm{O}$ (solid, $\mathbf{0}^{\circ}$ ) $\rightarrow \mathrm{H}_{2} \mathrm{O}\left(\right.$ solid, $\left.-10^{\circ}\right)$
Thus, these two paths must have the samed since $S$ is a state function.
$\Delta S$ for the reversible path is the sum of the threas values calculated in parts (a), (b), and (c) above.
$\Delta S=[2.81+(-22.07)+(-1.41)]$ joules/ mole-deg $\Delta S=(-20.67)$ joules/ mole-deg
e) (10 points) Calculate the change in free energy ( $\Delta G$ ) when one mole of liquid water at $-10^{\circ} \mathrm{C}$ is converted isothermally and irreversibly to ice at $10^{\circ} \mathrm{C}$. Show all reasoning clearly.
$\Delta G=\Delta H-\Delta(T S)$
Isothermal process has $T=$ constant, so
$\Delta \mathbf{G}=\Delta \mathbf{H}-\mathbf{T} \Delta \mathbf{S}$
$T=263, \Delta H_{\text {fusion }}=5649$ joules (given)
$\Delta H=-5649$ joules (liquid to solid is opposite direction from fusion)
$\Delta G=-5649$ joules/ mole -(263 deg)(-20.67 joules/ mole-deg)
$\Delta G=-5649$ joules/ mole +(5436 joules/ mole)
$\Delta G=-212$ joules/ mole

The End
