Clinical Scenario #1

• 23 y.o woman presents to her doctor complaining of 1 day of increased urinary frequency, dysuria and sensation of incomplete voiding
• She is otherwise healthy, takes no medications, and is sexually active, using spermicide-coated condoms for contraception. She says she does not have fever, chills, vaginal discharge, or flank pain
• Sexually active with one partner, no hx/o sexually transmitted diseases
Clinical Scenario #1

- She looks a little uncomfortable but is afebrile, with a normal blood pressure
- Her abdominal exam is notable for mild suprapubic tenderness, no RUQ tenderness, no costovertebral tenderness
- Pelvic exam is deferred

Clinical Scenario #1 : Labs

- Urinalysis: pyuria (WBC too numerous to count), RBC and bacteria present
- Urine dipstick: positive leukocyte esterase and nitrite
- Urine culture: not done
- Patient receives 3 days of TMP/SMX for UTI
Gram stain of urine shows numerous Gram-negative rods. 
*E. coli* grew from this urine specimen

UTI: Definitions

- **Lower UTI**: cystitis, urethritis, prostatitis
- **Upper UTI**: pyelonephritis, intra-renal abscess, perinephric abscess (usually late complications of pyelonephritis)
- **Uncomplicated UTI** – Infection in a structurally and neurologically normal urinary tract. Simple cystitis of short (1-5 day) duration
- **Complicated UTI** – Infection in a urinary tract with functional or structural abnormalities (ex. indwelling catheters and renal calculi). Cystitis of long duration or hemorrhagic cystitis.

UTI: Clinical Symptoms and Presentation

- **Cystitis in the adult**:
  - Dysuria, urinary urgency and frequency, bladder fullness/discomfort
  - Hemorrhagic cystitis (bloody urine) reported in as many as 10% of cases of UTI in otherwise healthy women
- **Pyelonephritis (upper UTI) in the adult**:
  - Fever, sweating
  - Nausea, vomiting, flank pain, dysuria
  - Signs and symptoms of dehydration, hypotension
- **A history of vaginal discharge suggests that vaginitis, cervicitis, or pelvic inflammatory disease is responsible for symptoms of dysuria (pelvic examination)**
  - Important additional information includes a history of prior sexually transmitted disease (STD) and multiple current sexual partners.
- **UTI in children**:
  - < 2 years - enuresis, fever, poor weight gain
  - > 3 years - dysuria, lower abdominal pain
Diagnosis of UTI

• U/A microscopic examination
  – WBC, RBC
  – Presence of bacteria
• Urine dipstick test: rapid screening test
  – leucocyte esterase test
  – Nitrate $\rightarrow$ nitrite test (+ in only 25%)
• Indications for urine culture
  – Pyelonephritis
  – Children, pregnant women
  – Patients with structural abnormalities of the urinary tract

Indications for Evaluating the Urinary Tract

• Children
  – ultrasound, IVP, CT scan
• Bacteremic pyelonephritis not responding to therapy
  – ultrasound, IVP, CT scan
• Nephrolithiasis or Neurogenic Bladder
  – Ultrasound, CT, or IVP with post-voiding films
• Men with 1st or 2nd infection
  – Careful prostate examination
  – Ultrasound or IVP with post-voiding films

• Microbiology and Epidemiology
• Pathogenesis
  – Host Factors
  – Bacterial Factors
• Clinical Scenario
• Treatment and Prevention

Pathogenesis of UTI

• Hematogenous Route
• Ascending Route
  – Colonization of the vaginal introitus
  – Colonization of the urethra
  – Entry into the bladder
  – Infection
UTI in Women: Factors Predisposing to Infection

- Short urethra
- Sexual intercourse & lack of post coital voiding
- Diaphragm, spermicide use
- Estrogen deficiency
- P₁ blood group - upper UTI
Host Factors Predisposing to Infection

- Extra-renal obstruction
  - Posterior urethral valves
  - Urethral strictures
- Renal calculi
- Incomplete bladder emptying
- Neurogenic bladder
- Immunocompromised individuals (e.g. DM, transplant recipients)

Bacterial Virulence Factors-I

- Enhanced adherence to receptors on uroepithelial cells
  - **Type 1 fimbriae**: mediate binding to uroplakins, mannosylated glycoproteins on the surface of bladder uroepithelial cells
  - **P fimbriae**: bind to galactose disaccharide on the surface of uroepithelial cells and to P blood group antigen (D-galactose-D-galactose residue) on RBCs
    - 97% of women with recurrent pyelo are P1 blood group (+)
    - Higher prevalence of P-fimbriated *E.coli* in cystitis-causing strains than in strains from asymptomatic persons (60% vs. 10%)
  - Phase variation:
    - Type 1 fimbriae increase susceptibility to phagocytosis, P-fimbriae block phagocytosis
    - In strains that cause upper-tract infections: Type 1 down-regulated, Type P upregulated (PAP gene expression triggered by temperature, [glucose], concentration of certain amino acids)
Electron microscopic view of an *E. coli* showing the fimbriae (pili) bristling from the bacterial cell wall.
Bacterial Virulence Factors-II

- Flagella- enhanced motility
- Production of hemolysin induces pore formation in cell membrane cell lysis (nutrient release)
- Production of aerobactin (a siderophore) iron acquisition in the iron-poor environment of the urinary tract

Antibacterial Host Defenses

- Urine flow and micturition
- Urine osmolality and pH
- Inflammatory response (PMNs, cytokines)
- Inhibitors of bacterial adherence
  - Bladder mucopolysaccharides
  - Secretory immunoglobulin A
The pathophysiology of infection by uropathogenic Escherichia coli in bladder epithelial cells: interaction between bacterial factors and host defense mechanism.

From Cohen & Powderly: Infectious Diseases, 2nd ed., 2004
Clinical Scenario #2

- 43 y.o woman with DM presents to the ER complaining of chills, nausea and low back pain for the past 2 days. Earlier in the week she developed increased urinary frequency and dysuria.
- Recognizing the symptoms of UTI she took two days of TMP/SMX but was unable to finish treatment because of nausea and vomiting
- Past medical history is notable for frequent UTIs treated with TMP/SMX and a history of Diabetes Mellitus
- No hx/o STDs, no vaginal discharge

Clinical Scenario #2

- She looks unwell and appears uncomfortable
- She is febrile to 101.2, tachycardic to 100 with a BP 100/60
- On exam her mucous membranes are dry; there is suprapubic tenderness, and severe right flank and right costovertebral tenderness
- Urinalysis, Urine microscopic examination and urine culture are performed: pyuria, hematuria, bacteriuria
- Blood cultures are drawn
- Patient is admitted to the hospital for IV antibiotics and pain management
Clinical Scenario #2

- The next day, urine and blood cultures show Gram-negative rods
- After 72 hours of hydration and intravenous antibiotics, your patient is still febrile, and repeat urine examination is still notable for pyuria, bacteriuria
- You are concerned about
  - urinary obstruction
  - intrarenal/perinephric abscess
  - infection with resistant organism

Clinical Scenario #2

- Microbiology lab informs you that the pathogen is an *E.coli* sensitive to fluoroquinolones, resistant to TMP/SMX
- Renal CT is notable for a large renal abscess
- Diagnosis: pyelonephritis complicated by a renal abscess in a diabetic patient
Renal abscess on ultrasonography

Ultrasonic examination of the kidney showing an abscess cavity (arrow). The internal echoes within the lesion can also be seen with a malignancy but not with a simple cyst. Courtesy of Alain Meyrier, MD.

Renal abscess on CT scan

CT scan showing a large renal abscess with internal echoes in the right kidney (arrow). Courtesy of Alain Meyrier, MD.
UTI: Upper Tract Disease

- Symptoms suggestive of upper tract disease (pyelonephritis):
  - Fever (usually greater than 101°F),
  - Nausea, vomiting, and
  - Pain in the costovertebral areas
  - Urinary frequency, urgency and dysuria
  - Renal abscess: patients with urinary tract abnormalities, diabetic patients
- Evaluation: urine culture, +/- blood cultures,
  - Imaging if no improvement
- Microbiology: *E.coli*, and *Citrobacter, Pseudomonas aeruginosa, Enterococci, Staphylococcus spp.*
- Initial therapy: intravenous antibiotics for 10-14 days (perinephric abscess treat longer, +/- drainage)
Pyelonephritis - papillary necrosis

Urinary Tract Infections

- Definitions
- Clinical Symptoms and Diagnosis
- Microbiology and Epidemiology
- Pathogenesis
  - Host Factors
  - Bacterial Factors
- Clinical Scenario
- Treatment and Prevention
Treatment: General Principles

• Quantitative cultures may be unnecessary before treatment of typical cases of acute uncomplicated cystitis.
• Culture urine in patients with upper UTI, complicated UTI, or with treatment failure.
• Susceptibility testing is necessary in all recurrent or complicated infections, perhaps not for uncomplicated cases.
• Identify or correct factors predisposing to infection
  – Obstruction, calculi
  – Diabetic patients who are at risk for recurrent infections, pyelonephritis and perinephric abscesses

Treatment: General Principles

• Recurrent infections common in young women (20% by 6 months).
  – Majority are exogenous infections rather than failure to cure initial infection

• Duration of therapy depends on the site and duration of the infection.
Empiric Antimicrobials

- Choice of antimicrobial agents
  - Primary excretion routes through the urinary tract
  - Achieve high concentration in urine and vaginal secretions
  - Inhibit *E. coli*, the primary pathogen in cystitis

- Short course (3-day) therapy for uncomplicated infections

- Longer duration (10-14 days) for complicated infection (e.g., pyelonephritis)

- Oral vs. intravenous agents (TMP/SMX, Fluoroquinolones)
Treatment of Asymptomatic Bacteriuria

- Pregnant women
- Patients with neurological or structural abnormality of the urinary tract
- Patients undergoing urologic surgery

Cohen & Powderly: Infectious Diseases, 2nd ed., 2004
Recurrent UTI

- Risk factors for recurrent uncomplicated UTI
  - P1 blood group positive; postmenopausal status; diabetes
  - Recent antimicrobial use
  - Behavioral risk factors (spermicide use, new partner, first UTI <15 y.o.)

Prevention Strategies

- Prevention Strategies
  - Alternative methods of contraception
  - Postcoital voiding and increased fluid intake
  - Cranberry juice (sexually active women with previous UTI)
  - Antibiotic prophylaxis
    - >2 symptomatic UTIs within six months or >3 over 12 months
    - Postcoital prophylaxis vs. continuous prophylaxis vs. self-treatment
Antimicrobial Resistance

- Reports of increased resistance to TMP/SMX
- Regional variation
- Rates between 18-40%
