

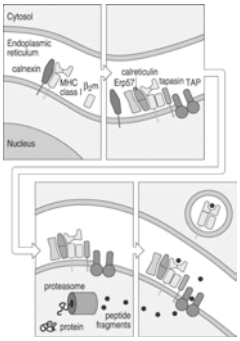
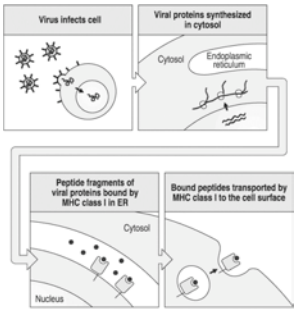
Peptide Loading on MHC Class I in the ER



What Cells Do When the Blitz is On



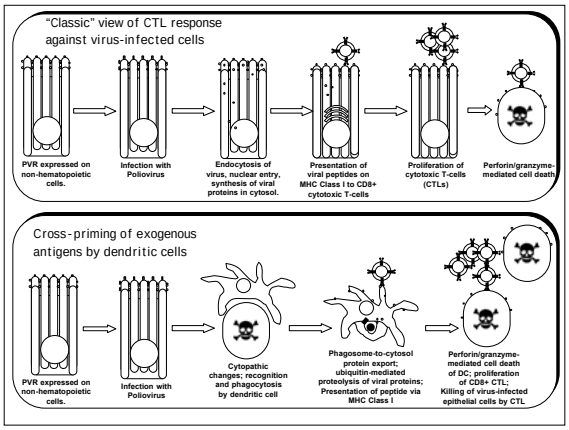
Antigen Presentation Pathways;
Two Old:

MHC Class I presentation of peptides
MHC Class II presentation of peptides

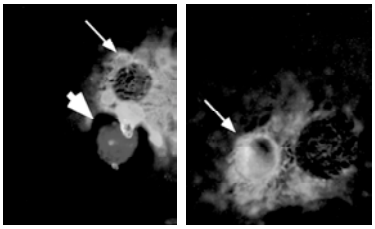
and Two New:

Cross-priming of exogenous peptides (MHC Class I)
CD1-mediated presentation of glycolipids

Question: How do viruses that don't infect "professional APCs" such as dendritic cells elicit a primary immune response? After all, virally-infected cells normally don't traffic to 2° lymphoid organs



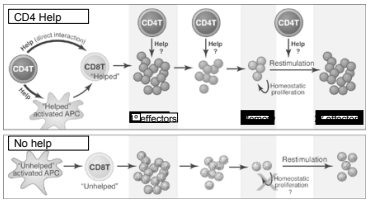
Cross-priming: A Dendritic Cell Engulfs a Virus-infected Macrophage



From: Albert et al., *J. Exp. Med.* 188:1359, 1998

Question: Does development of the cytotoxic T cell response require "help" from CD4 cells (analogous to help for B cells)?

CD8 T Cells Need Help With Their Memory*



*You will, too, in a couple of years

Memory T-cells Don't Forget

Table 1 Estimated survival of virus-specific T-cell memory after smallpox vaccination

Vaccinations	Volunteers with CD4+ T-cell memory[a] 20–30 years[b]	31–50 years	51–75 years	$t_{1/2}$ of CD4+ T cells[c]
1	100% (16/16)	89% (70/79)	52% (23/44)	10.6 (0–17)
2	83% (10/12)	78% (29/37)	57% (4/7)	8.3 (0–14.1)
3–14	82% (23/28)	91% (29/32)	ND[d]	12.4 (0–20.5)

Vaccinations	Volunteers with CD8+ T-cell memory 20–30 years	31–50 years	51–75 years	$t_{1/2}$ of CD8+ T cells
1	50% (8/16)	49% (39/79)	50% (22/44)	15.5 (0–27.1)
2	42% (5/12)	38% (14/37)	57% (4/7)	8.1 (0–16.9)
3–14	46% (13/28)	50% (16/32)	ND	9.0 (0–18.1)

[a]Percentage of volunteers with vaccinia-specific T-cell memory is based on the proportion of immunized participants with >10 IFN-γ^+TNF-α^+ T cells per 10^6 CD4+ or CD8+ T cells, respectively. This cutoff provides 100% sensitivity at 3 months after vaccination or revaccination and 92–96% specificity, based on the vaccinia-induced IFN-γ response in T cells from unvaccinated volunteers. [b]Years after the last smallpox vaccination. [c]Estimated half-life ($t_{1/2}$) in years (and 95% confidence interval in parentheses) is based on linear regression analysis using data from Figures 1 and 2. N.D., not determined.

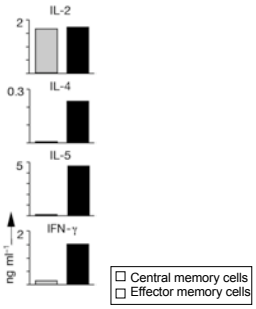
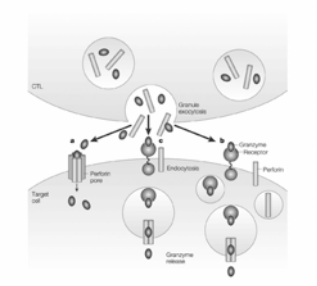
Effector Memory Cells Can Secrete Cytokines



From: Sallusto et al., *Nature* 401:708, 1999

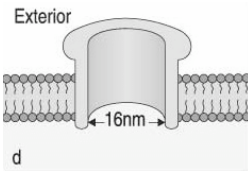
CYTOTOXIC T-LYMPHOCYTE:
A specialized white blood cell responsible for eliminating unwanted body cells (e.g. cancer) is killing a cell infected with the influenza virus

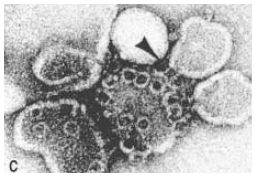
Cooperation in Killing: Granzyme and Perforin



From: Barry & Bleackely. *Nature Rev. Immunol.* 2:401, 2002

Structure of Perforin





Human Diseases Involving Defective Granule Killing*

Disease	Gene	Clinical Manifestations
Chediak-Higashi Syndrome	CHS1	Lysosomal inclusions in all leukocytes Recurrent bacterial infections **Decreased NK cell function** Oculocutaneous albinism (melanosome defect) Bleeding (platelet storage granule defect)
Griscelli Syndrome	Rab27a	Partial albinism Hepatosplenomegaly (lymphohistiocytic infiltration) **Decreased NK cell function**
Hermansky-Pudlak Syndrome	HPS1	Oculocutaneous albinism (melanosome defect) Bleeding (Platelet storage granule defect) Pulmonary fibrosis (Type II cell surfactant body inclusions)
Familial Hemophagocytic Lymphohistiocytosis	Perforin (30% of cases)	Hepatosplenomegaly (accumulation of activated T-cell and macrophages) **Decreased NK cell function** Pancytopenia

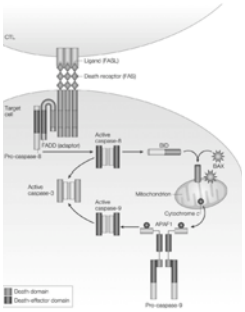
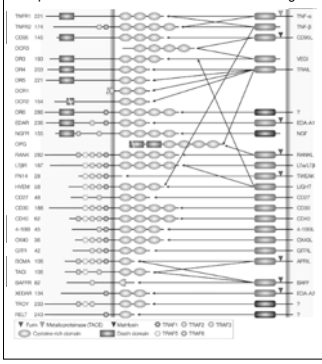
Life (and Death) in the Fas Lane



From: Barry & Bleackely. *Nature Rev. Immunol.* 2: 401, 2002

The TNF Superfamily and Selected Immune Functions

Receptor on T cell | Ligand



- Overlapping structure and function
- Death domain-containing members tend to induce cell death (but not always)
- Signaling via homotrimerization and recruitment of adaptor proteins
- In addition to regulating cell survival, many members participate in co-stimulation

From: Aggarwal, *Nature Rev. Immunol.* 3:745, 2003

The TNF Superfamily and Selected Immune Functions

Receptor on T cell	Ligand	Immune Function	Disease Associations
TNFR1 TNFR2 Fas	TNF-α TNF-β Fas-L	Apoptosis Inflammation	RA, IBD, psoriasis ALPS
RANK LTβR	OPG RANKL LTα/β	Bone resorption (osteoclasts) Lymph node development; Th1 responses	RA many
CD40L 4-1BB OX40	CD40 41BBL OX40L	Ig class switching Co-stimulation of memory CD8+ T cells Co-stimulation of activated CD4+ T cells	XLA viral GVHD, RA, IBD
BCMA TACI BAFFR	APRIL BAFF	B cell survival	CVID, RA

RA = Rheumatoid arthritis
IBD = Inflammatory bowel disease
ALPS = Autoimmune lymphoproliferative syndrome
XLA = X-linked agammaglobulinemia
GVHD = Graft-vs-host disease
CVID = Common variable immunodeficiency

Viral Evasion of Immunity

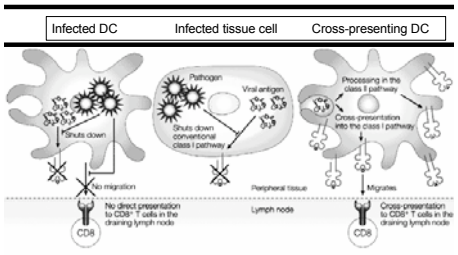
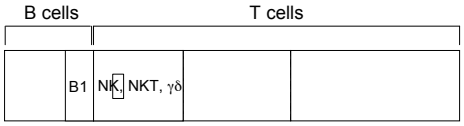
Cross-priming: DCs Fight Back



Major Lymphocyte Subpopulations in Peripheral Blood and Selected Effector Functions

B cells	T cells		
B	"Other"	CD8	CD4
Ab production Ag presentation		Cytotoxicity	Help to B cells Help to CD8 T cells Cytokine secretion

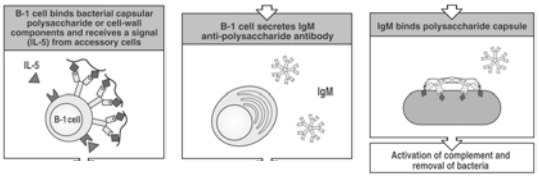
Innate-like Lymphocytes



Innate-like B Lymphocytes

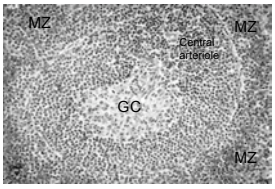
B-1 cells		
Make natural antibody, protect against infection with *Streptococcus*		
Ligands not MHC associated		
Cannot be boosted		

B-1 Cells: B Prepared



Thymus-independent Antigens are Presented to Specialized B-cells

Marginal zone B cells, like B-1 cells, respond to carbohydrate antigen and secrete mainly IgM

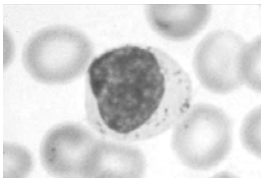


After the initial encounter of Ag, they demonstrate little memory (like trying to cram this course).

Innate-like T Lymphocytes: NK Cells

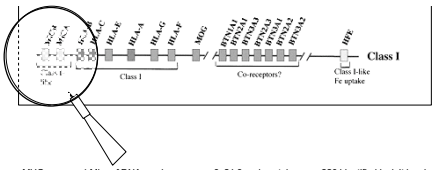
			NK cells
			Produce cytokines rapidly
			Ligands not MHC associated
			Cannot be boosted

Natural Killer Cell



How do NK Cells Recognize Their Targets?

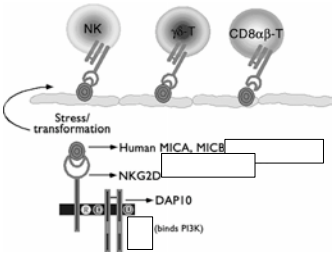
Major Genes in the MHC Class I Region



The human MHC covers ~4 Mbp of DNA on chromosome 6p21.3 and contains over 220 identified loci. It has been divided into three regions: class II (centromeric), class III, and class I (telomeric) with extended class I and class II regions on either side. This is one of the most gene-dense regions of the human genome. It encodes the most polymorphic human proteins known to date. Of the expressed loci in the MHC, roughly 40% are associated with the immune system. They include the classical class I, *HLA-A, -B,* and *-C*, nonclassical *HLA-E, -F,* and *-G*, as well as "postmodern" *MICA* and *MICB* genes (MHC class I chain-related genes). The products of classical polymorphic class I genes, HLA-A, B, and C, interact with T cell receptor (TCR) molecules as well as with the products of the *killer immunoglobulin-like receptor* (*KIR*) genes expressed on natural killer cells and some T cells.

Trowsdale., *Immunity*. 15:363, 2001

One Mechanism of Triggering NK Cell Cytotoxicity



The NKG2D-DAP10 receptor complex and its ligands. Cytotoxicity requires the expression of ligands of NKG2D (e.g., MICA, MICB) in the "stressed" target cells.

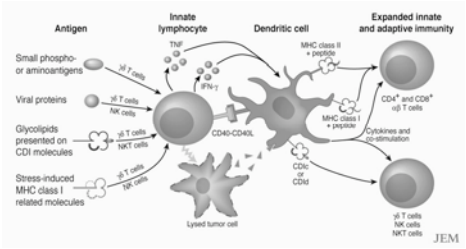
Question: Do lymphocytes of the acquired immune system even care about lymphocytes of the innate immune system?

Innate Immune Lymphocytes Trigger Dendritic Cell Maturation



From: Munz et al., *J. Exp. Med.* 202:203, 2005

Summary

1. For cytotoxic CD8 T-cells, ligation of the TCR by MHC I/peptide + co-stimulation results in release of granzymes and perforin and/or FasL, leading to apoptosis of the target cells.

2. Viruses evade host defense, in part, by down-regulating MHC Class I. Uninfected dendritic cells circumvent this by "cross-priming": phagocytosis of virus-infected cell and presentation of "exogenous" viral antigens on MHC Class I.

3. CD8 T cells can function without CD4 help, but need CD4 help to develop into effective memory cells. CD4 memory cells live for years; central memory cells home to lymph nodes and effector memory cells home to inflamed tissue.

4. NK cells lack TCRs, but instead express both activating and inhibitory (e.g., KIRs) receptors at their surfaces. The relative expression and ligation of these receptors determines the outcome (i.e., killing or not) of the NK effector response.

5. Innate immune B-cells (e.g., B-1 cells and marginal zone B cells) recognize carbohydrate antigens, secrete IgM, and are not long-lived.

6. Innate immune T-cells ($\gamma\delta$ T-cells, and NK T cells) recognize non-peptide antigens in non-classical MHC-like molecules. They mediate cytotoxicity, rapid cytokine secretion, and trigger maturation of DCs (and therefore initiate acquired immunity).
