

# Tumor Immunity (Clynes)

## Tumor Immunology

- Does it exist?  
i.e., does the immune system recognize and eradicate cancer cells? Is there any evidence for immunological surveillance (Burnett and Thomas)?
- How can the immune system recognize cancer if it is essentially self-tissue? (Tolerance)
- If it does not- can it be made to do so?  
(Immunization designed to Break Tolerance)  
Where is the danger-the innate activator?

## The Good News/Bad News Story

The immune system can destroy self-tissue quite effectively in autoimmunity, and in a tissue-specific (antigen-specific) manner: (thyroiditis, hepatitis, pancreatitis (diabetes), vitiligo, ITP, AIHA, graft rejection etc.). So, self-tissue destruction can be potent.

- Are there ongoing anti-tumor immune responses in patients with cancer?  
- Spontaneous remissions are rare but can occur, renal cell CA, melanoma, and are associated with anti-tumor Abs and CTLs.

TIL cells (tumor infiltrating cells) include CTLs that recognize melanoma antigens/peptides (6/11 patients). But these CTLs were anergic; could not kill targets or produce  $\gamma$ -IFN.

- So..the good news is that immune recognition of tumor antigens occurs but the bad news is that this occurs without activation of immune effector responses.

## More "good" news

### Evidence for Immunological Surveillance in Man

#### Cancer Incidence Increases in Immunosuppressed

- Increased incidence of malignancies in HIV patients: EBV lymphoma, KS, squamous cell CA –but many of these are virally induced malignancies; this merely shows that eliminating a T cell response against **virial** antigens allows for the outgrowth of virally-transformed cells. Common variety neoplasms (colon, breast, prostate, lung, etc..) may be seen with increased frequency as HIV patients live with their disease longer
- In **transplant associated EBV lymphomas** (presumably arise after the loss of EBV specific CTLs associated with T-cell depleted allo-BMT. Cures are achievable by infusion of donor T cells (reconstitute CTL response). Again loss of an anti-viral responses is implicated. (post-transplant patients are also at increased risk for melanoma and sarcoma).

### Immunosurveillance: Tumors which Evolve in Lymphocyte Deficient Hosts are Rejected in WT Mice

Tumor (Sarcoma) Incidence is Increased in MCA-treated Lymphocyte Deficient Mice

Tumor: WT origin Tumors which developed in RAG-/- hosts are REJECTED in WT Recipients

RAG-/- origin

Host: RAG-/- WT

### Immune Surveillance: Tumor Cell Expression of IFN $\gamma$ Receptor is Required for Lymphocyte-Mediated Tumor Rejection

Tumor Incidence after MCA Treatment

IFN $\gamma$ R-/- WT

Transplanted tumor

WT IFN $\gamma$ R-/- IFN $\gamma$ R-/- transfected with IFN $\gamma$ R IFN $\gamma$ R-/- transfected with IFN $\gamma$ R

Tumor Size

Host: WT WT WT RAG-/-

# Tumor Immunity (Clynes)

Immune surveillance:

1. Innate system  
NK, NKT, gamma/delta T cells

IFN- $\gamma$ , IL-12 (APC)

2. Functional conventional T cells

Phenotype or depletion	Immunodeficiency	Tumor susceptibility
RAG-2 <sup>-/-</sup>	T, B and NKT cells	MCA-induced sarcoma <sup>10</sup> Spontaneous intestinal neoplasia <sup>10</sup>
RAG-2 <sup>-/-</sup> x STAT1 <sup>-/-</sup>	T, B and NKT cells	MCA-induced sarcoma <sup>10</sup> Spontaneous intestinal and mammary neoplasia <sup>10</sup>
IR60 <sup>-/-</sup>	Insensitivity to IFN- $\gamma$ and IFN- $\alpha/\beta$	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
BALB/c-SCD	T, B and NKT cells	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
Perforin <sup>-/-</sup>	Lack of perforin	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
TCR $\beta$ 281 <sup>-/-</sup>	Subset of NKT cells	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
Anti-anti-CD11 antibody	NK cells and activated macrophages	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
Anti-NK1.1 antibody	NK and NKT cells	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
Anti-37 $\beta$ 1 antibody	T cells	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
g $\delta$ T cell <sup>-/-</sup>	g $\delta$ T cells	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
$\gamma\delta$ T cell <sup>-/-</sup>	g $\delta$ T cells	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
STAT1 <sup>-/-</sup>	Insensitive to IFN- $\gamma$ and IFN- $\alpha/\beta$	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
IFNGR1 receptor <sup>-/-</sup>	Insensitive to IFN- $\gamma$	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
IFN- $\gamma$ <sup>-/-</sup>	Lack of IFN- $\gamma$	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup> C57BL/6 Spontaneous lung adenocarcinoma <sup>10</sup> BALB/c Spontaneous lung adenocarcinoma <sup>10</sup>
Perforin <sup>-/-</sup> x IFN- $\gamma$ <sup>-/-</sup>	Lack of perforin and IFN- $\gamma$	MCA-induced sarcoma <sup>10</sup> Spontaneous disseminated lymphomas <sup>10</sup>
IL-12 <sup>-/-</sup>	Lack of IL-12	MCA-induced sarcoma <sup>10</sup> Lower incidence of MCA-induced sarcoma <sup>10</sup>
WT x IL-12	Expression IL-12	

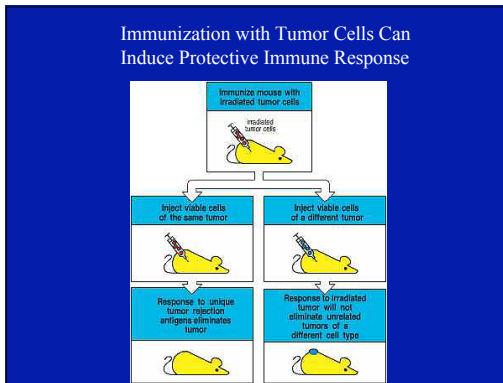

Methylcholanthrene-treated wild-type (WT) mice were treated with E-12 during tumor formation.

## More good news/ Evidence for Immunological Surveillance

- In mice, absence of IFN- $\gamma$ R, STAT1, IL-12, perforin, RAG, NK cells: All of these genetic deficiencies have an increased incidence of MCA (carcinogen) induced malignancies.

Evidence that IFN-induced antigen presentation by tumor cells provides immunity (as with viral immunity). IFN- $\gamma$  R<sup>-/-</sup> tumors grow in WT mice, unless transfected with TAP. Highly immunogenic tumors emerge in RAG<sup>-/-</sup> mice; these tumors grow in RAG<sup>-/-</sup> (in absence of immune selective pressure) but are rejected in WT mice (in presence of normal immune response).

Macrophages are primary source of IL-12 which induce NK and T cell production of IFN- $\gamma$ . (which in turn activates STAT1 in the tumor and in immune cells)

## Candidate Tumor Antigens

Antigen Class	Antigen	Advantages/Disadvantages
Whole Cell	Protein lysate or tumor RNA based expression	Universal (Autoimmunity may be a problem)
Antigen-Specific	Peptide, DNA or recombinant protein	"Customized" therapy are required for these approaches. For whole proteins "antigen profile" of each tumor is required. Peptides require additional info. of indiv. HLA-type. Antigenic modulation or loss (overcome by attacking multiple targets and antigens required for transformed phenotype).

# Tumor Immunity (Clynes)

### Candidate Tumor Antigens..many more to come through genomics

- Shared Tumor Antigens** (common across tumors and tumor types) Allows single therapy to be applicable for many patients
  - Cancer/testes genes
  - Differentiation associated antigens
  - Others including gangliosides, MUC-1, etc.,
- Unique Tumor Antigens** (requires tumor specific therapy) Antigenic modulation would potentially interfere with malignant phenotype.
  - Overexpressed proto-oncogenes: EGFR, HER2
  - Point mutations: ras,  $\beta$ -catenin, CDC27, CDK4, Bcr/Abl
  - Viral Antigens: Human papilloma virus, EBV, Hepatitis B

Antigen Class	Antigen	Malignancy
Tumor Specific Antigen	Immunoglobulin Idiotype TCR	B lymphoma, MM T cell lymphoma
	Mutant ras  Mutant p53 p21- <i>bcr-abl</i> fusion	Colorectal, lung, bladder, Head and neck cancer Pancreatic, Colon, Lung CML, ALL
Developmental Antigens (cancer/testes genes)	MAGE-1, MAGE-3, GAGE family, 20 genes on the X chromosome Telomerase	Melanoma but also in colorectal, lung, gastric Various
Viral Antigens	Human Papilloma Virus EBV	Cervical, penile cancer Burkitt's lymphoma, nasopharyngeal Ca, post- Tx lymphoproliferative
Tissue-specific self- antigens (Differentiation antigens)	Tyrosinase, gp100, trp-1, trp-2 Prostatic acid phosphatase, PSA Thyroglobulin $\alpha$ -Fetoprotein	Melanoma Prostate Thyroid Liver Cancer
Over-expressed self- antigens	Her-2/neu CEA Muc-1	Breast and lung cancer Colorectal, lung, breast Colorectal, pancreatic, ovarian, lung

### IMMUNE RECOGNITION

#### Tumor Evasion

**Tumor cells are poorly immunogenic**

Therefore cross-priming required (overcomes obstacles 1-4)

**Poor APCs**

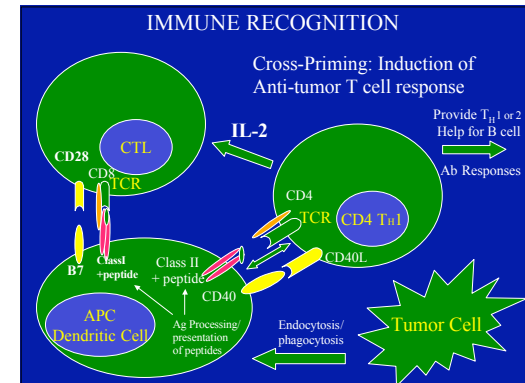

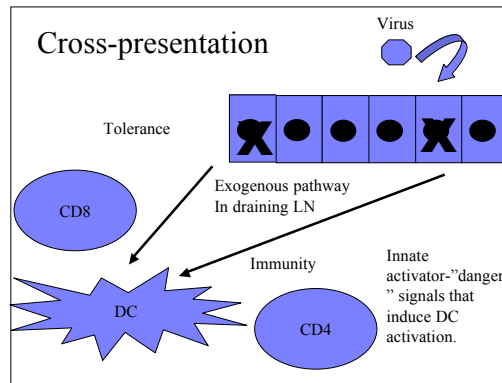

- 1) Often no class I
- 2) No class II
- 3) No costimulatory molecules
- 4) Few adhesion molecules
- 5) Antigenically largely self

### IMMUNE RECOGNITION

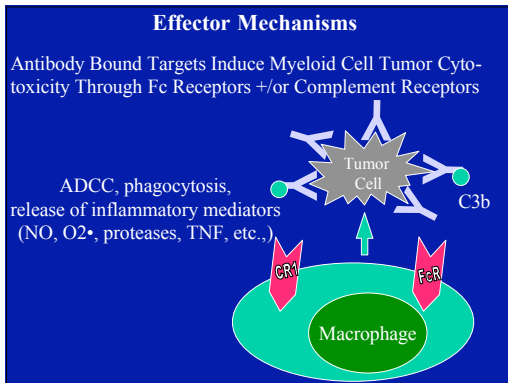

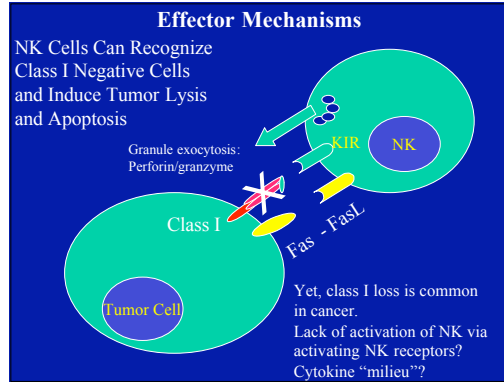

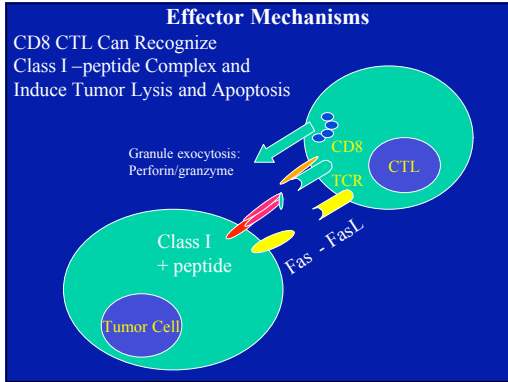

#### Cross-Priming

- Host somatic cellular antigens (i.e. not soluble antigens) are able to be presented to immune system by host APCs.
- True for viral antigens and cancer antigens.

Immature DC → Phagocytosis → Dendritic Cell or apoptotic cell → Antigenic processing and presentation of antigen on class I and II → Activation ?? → Mature DC

# Tumor Immunity (Clynes)

# Tumor Immunity (Clynes)

## Tumor Evasion: Two separate problems

- Tumor antigens are not recognized by immune response-poorly immunogenic (*Immunologically ignorant*).
- Tumors and tumor environment are resistant to or inhibit immune cytotoxic responses. (*active suppression*—either dampen “priming” or inhibit/resist effector cell function).

## Bad News/Tumor Evasion Resistance to Effector Response

Tumor Cell Properties

- Intrinsic resistance  
Upregulation of genetic “survival” pathways (**anti-apoptotic genes**), e.g. akt, Bcl-2, etc.,
- Resistance to death receptor pathways: Reduction of Fas receptor or enhanced expression of c-FLIP by tumors may render tumors resistance to fas-mediated apoptosis. Similarly, tumors commonly lose TRAIL receptors or express “decoy” receptors.
- Loss of tumor antigen expression: **Tumor heterogeneity** (need to target multiple antigens)-and possibly proteins essential for transformation/growth.
- Loss of antigen presentation capacity by tumor

## More Bad News/Tumor Evasion Resistance to Effector Response

2 pages of problems...not good

Local Inhibitory Factors in the Tumor Stroma produced by  
1) tumor cells themselves or by 2) stromal T cells or macrophages

- Tumor cell or Tumor-associated-macrophage production of local factors (TGF- $\beta$ , IL-10) that suppress T cell responses and DCs (VEGF, and TGF- $\beta$ , IL-10)
- Conventional T cells and DCs may be suppressed by **Treg cells** preferentially induced or recruited by tumor. (early clinical promise with Treg depleting approaches and anti-CTLA4 antibodies).

**FOXP3+ Tregs in human tumor (ovarian tumor ascites)**

T regulatory cells are also present in draining lymph node. Thereby inhibiting both T cell priming (in the lymph node) and effector T cell responses (in the tumor tissue)

# Tumor Immunity (Clynes)

**Autoimmunity Correlates With Tumor Regression in Patients With Metastatic Melanoma Treated With Anti-CTLA-4**

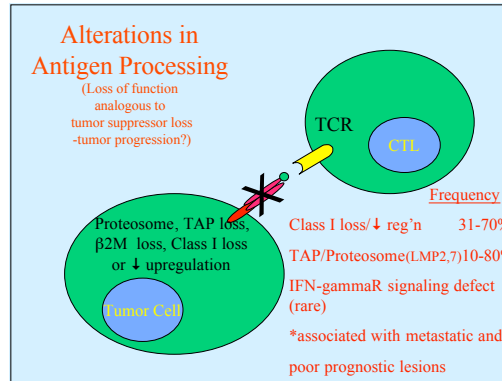

Grade 3/4 autoimmunity 30%  
(colitis, uveitis, hypophysitis, thyroiditis, hepatitis, dermatitis)

Tumor response rate 15%

Colitis

## Strategies for induction of anti-tumor Immune Responses -Passive-

- **Adoptive transfer of autologous tumor Ag-specific T cells:** "customized" therapy: Requires ex vivo expansion of cytokine-enhanced antigen-specific memory T cells. Has worked for EBV lymphoproliferative disorders and melanoma.
- **Monoclonal and engineered antibodies:**
  1. Humanized/chimeric mAbs: Herceptin (anti-HER2), Rituxan (anti-CD20, anti-idiotypic (custom therapy), anti-EGFR (Erbix), CAMPATH (anti-CD52), anti-VEGF (targets neovasculature, Avastin).
  2. Immune conjugates ("smart bombs") mAb-toxin (Mylotarg: anti-CD33 calicheamicin), mAb-chemo, mAb-isotope (anti-CD20 Zevalin and Bexxar).

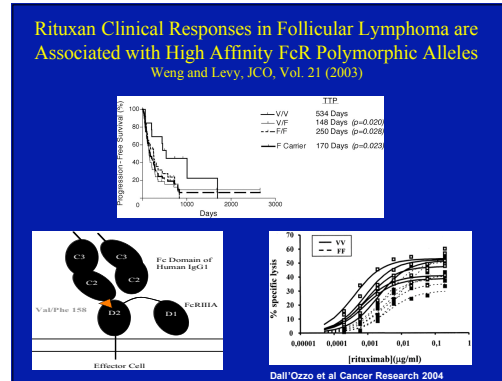

**Therapeutic Antibodies in Oncology**

mAb	Construct	Isotype	Target
Rituxan™ ( <i>rituximab</i> )	Chimeric	IgG1	CD20
Herceptin™ ( <i>trastuzumab</i> )	Humanized	IgG1	HER-2
Campath™ ( <i>alemtuzumab</i> )	Humanized	IgG1	CD52
Erbix™ ( <i>cetuximab</i> )	Chimeric	IgG1	EGFR
Avastin™ ( <i>bevacizumab</i> )	Humanized	IgG1	VEGF- A
Bexxar (Tositumomab) 1131	Mouse	IgG1	CD20
Zevalin™ ( <i>ibritumomab tiuxetan</i> )	Mouse	IgG1	CD20
Mylotarg™ ( <i>acemizumab ozogamicin</i> )	Humanized	IgG4	CD33
ABX-EGF	Human	IgG2	EGFR

# Tumor Immunity (Clynes)

## Strategies for induction of anti-tumor Immune Responses

### ACTIVE IMMUNIZATION

Goal is to define tumor antigens and then use them in an immunostimulatory fashion.

How to induce immune response and break tolerance: Essentially “the dirty little secret” of immunologists- *the adjuvant effect*: effective immunization usually requires mixing antigen with agents which promote uptake of antigen by APCs as well as activate and recruit APCs to vaccine site (e.g. Alum or Complete Freund’s Adjuvant: mineral oil/water emulsion + heat killed bacillus).

## How to present antigen: clinical trials

- Systemic cytokines (e.g. IFN $\alpha$ ); upregulate HLA/antigen processing, mature and activate APC
- Whole cell and adjuvant
- Tumor antigen protein or peptide and adjuvant
- Peptide and cytokines
- Turn cancer cell into an APC or a recruiter of APCs: transfect/infect tumor with costim. gene (B7) or with cytokine gene (GM-CSF), DC tumor cell fusion.
- Gene gun (DNA vaccination: tumor specific gene +/- costimulatory +/- cytokine genes)
- Autologous DC’s “pulsed” with protein, peptides etc. Attempts to deliver tumor peptide for cytosolic class I loading in activated DCs.

## Tumor Immunology: Summary

- Immunological recognition of tumor occurs. Tumor specific T cells are found in patients, but are ineffective. Classify the types of tumor antigens thus far identified.
- Tumors have emerged in individuals having successfully overcome immunological surveillance. Experimental data from mice are provided showing that immunological surveillance prevents tumor development and there are examples in humans in which cancers emerge in immunodeficient individuals.
- Evasion mechanisms include reduced tumor antigen presentation and local immunoregulatory factors: inhibitory cytokines and cells.
- Reversal of tolerogenic response is goal of immunotherapy. Passive immunization (antitumor antibodies, adoptive T cell therapy). Active immunization (vaccine=antigen plus adjuvant). The goal is to induce antigen specific effector T cells while eliminating regulatory negative immunoregulatory pathways.
