

Qualitative and Quantitative Platelet Disorders

Jeffrey S. Jhang, M.D.

Platelet Signaling

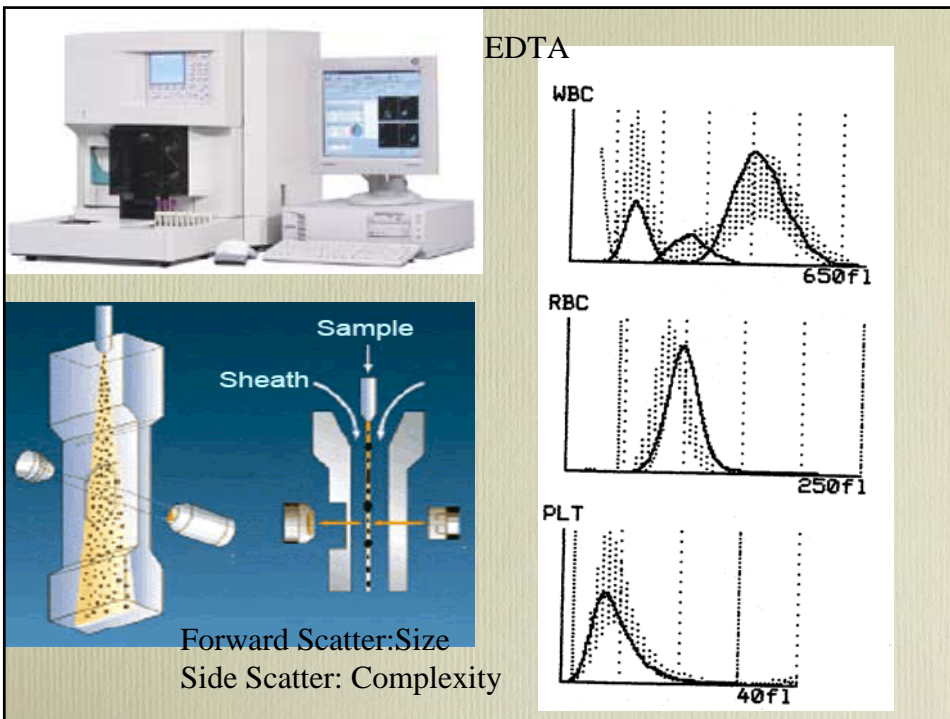

Platelet vs. Coagulation Bleeding

Findings	Coagulation	Platelet
Petechiae	Rare	Common
Hematomas and Hemarthroses	Common	Rare
Delayed Bleeding	Common	Rare
Bleeding cuts	Minimal	Persistent
Gender	Male	Women
Mucosal	Minimal	Typical

N.B. Some platelet disorders are associated with thrombosis (HIT, TTP)

Laboratory Tests

- Automated Cell Counter
 - Platelet Count
 - Mean Platelet Volume
 - Platelet Distribution
- Smear morphology
- Coagulation
 - PT, aPTT, Fib, TT
- Bleeding Time
- Aggregometry
- vWD
 - Ristocetin Cofactor
 - vWf:Ag
 - FVIII:C
 - Multimers

Case

22 year old student athlete undergoes a routine preoperative physical exam and laboratory studies prior to right knee arthroscopy; he has no significant past medical history; no bleeding or family bleeding history; he takes no medications; physical exam is unremarkable

WBC 5.0, Hct 45%, Plt 20K, smear next slide

Pseudothrombocytopenia

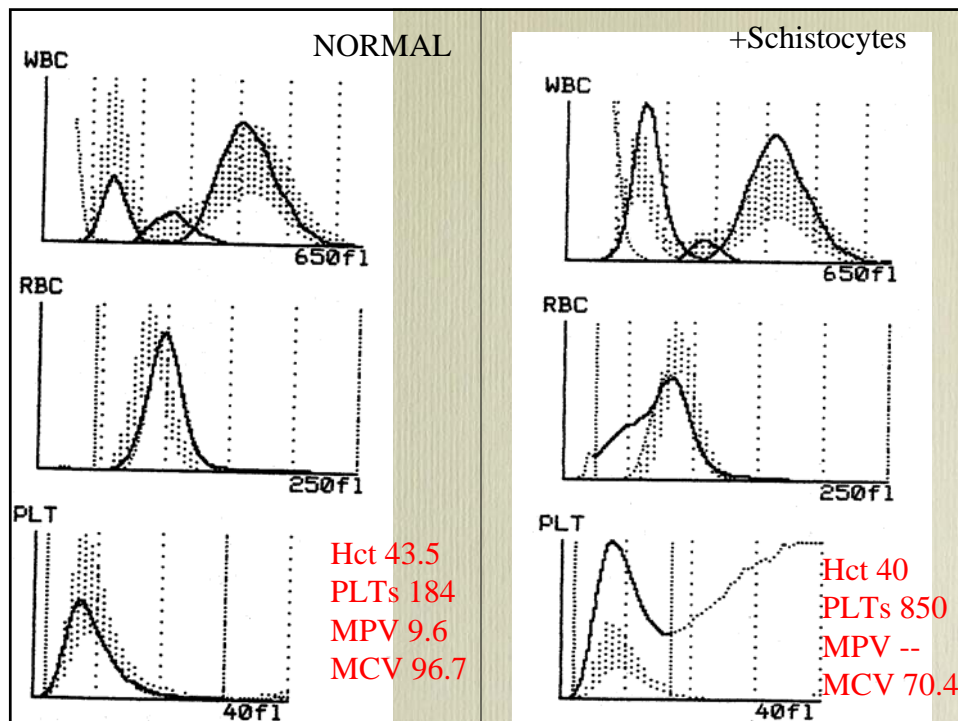

Anti-coagulant dependent agglutinins associated with EDTA

Re-rerun with citrate or heparin tube

Real or Spurious Platelet Count: Schistocytes

Platelets 200K, but platelets rarely seen on smear

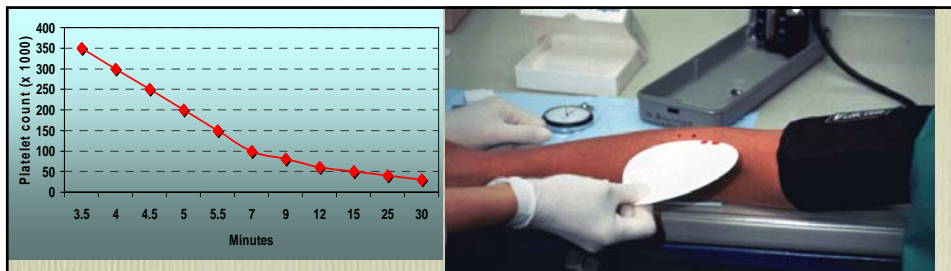

Platelet Morphology

Bernard-Soulier

Gray Platelet Syndrome

- To screen for inherited platelet dysfunction (e.g. vWD)
- Done under standardized conditions
 - 40 mmHg
 - Two small punctures on volar surface
 - Absorbed every 30 sec
 - Measured by time in minutes
 - Should not be done if $plt < 50K$, anemia or uremia
- Mainly affected by platelet number and function, hematocrit
- There is no evidence that the bleeding time predicts bleeding
- no correlation between bleeding time and visceral bleeding

Bleeding Time Prolonged

- Congenital
- Drugs (e.g. antiplatelet drugs +/- ASA)
- Alcohol
- Uremia
- Hyperglobulinemias
- Fibrin/fibrinogen split products
- Thrombocythemia
- Cardiac Surgery

Aggregometry

- Purpose: used to detect abnormalities in platelet function
- Principle: an aggregating agent is added to platelet rich plasma in a cuvette; as the platelets aggregate, the light transmission increases
- **Specimen: platelet rich plasma prepared from citrate whole blood with test completed within 3 hours of the collection**
- Procedure: soft spin to prepare platelet rich plasma prepared; hard spin to prepare platelet poor plasma (blank)

Interpretation

- Evaluate the slope of aggregation; both primary and secondary wave
- Evaluate the extent of aggregation
- Low dose ADP: two waves; high dose a single wave
- Epi biphasic in 80% of normal
- Collagen acts by releasing ADP so only a single wave
- Ristocetin antibiotic that makes vWf bind platelets and induces aggregation; normal tracing does not exclude vWD

Figure 41-2 Platelet aggregation studies: normal tracings. Adenosine diphosphate, epinephrine, collagen, and ristocetin are used as agonists.

Accumetrics

● Fibrinogen coated beads

Agonist (e.g. ADP)

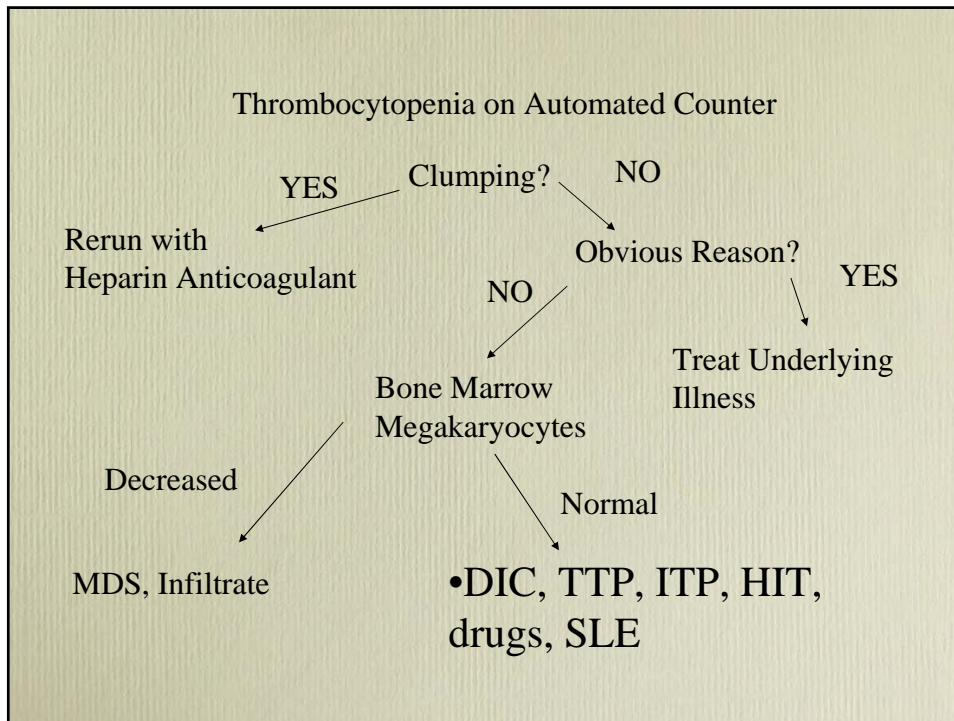

Evaluate as two groups

- Quantitative
 - Production, Destruction, Sequestration
- OR
- Qualitative
 - Adhesion, Aggregation, Secretion, Other

Quantitative

- Production
 - Reduced Megakaryocytes
 - Infiltration (e.g. tumor)
 - Aplasia (e.g. chemicals)
 - Congenital (e.g. WAS)
 - Ineffective
 - Megaloblastic anemia, myelodysplasia, ETOH
- Destruction
 - Immune
 - Autoantibody e.g. ITP
 - Alloantibody
 - NAIT, HIT
 - Consumption
 - DIC
 - TTP
 - Mechanical
- Sequestration
- Hemodilution
- Real or Spurious?

Case

- 75 year-old man with no significant past medical history s/p bowel resection for carcinoma. He spiked a temperature of 103. Blood and urine cultures are positive for GNR. He is noted to have petechiae on his legs. His venipuncture sites are oozing. No organomegaly.
- Data: WBC 25K with left shift, Hct 30%, Plts 20K. PT 21s, PTT 120s, Fib 80, D-Dimer>20 , schistocytes
- DDx: ITP, TTP/HUS, DIC, HIT

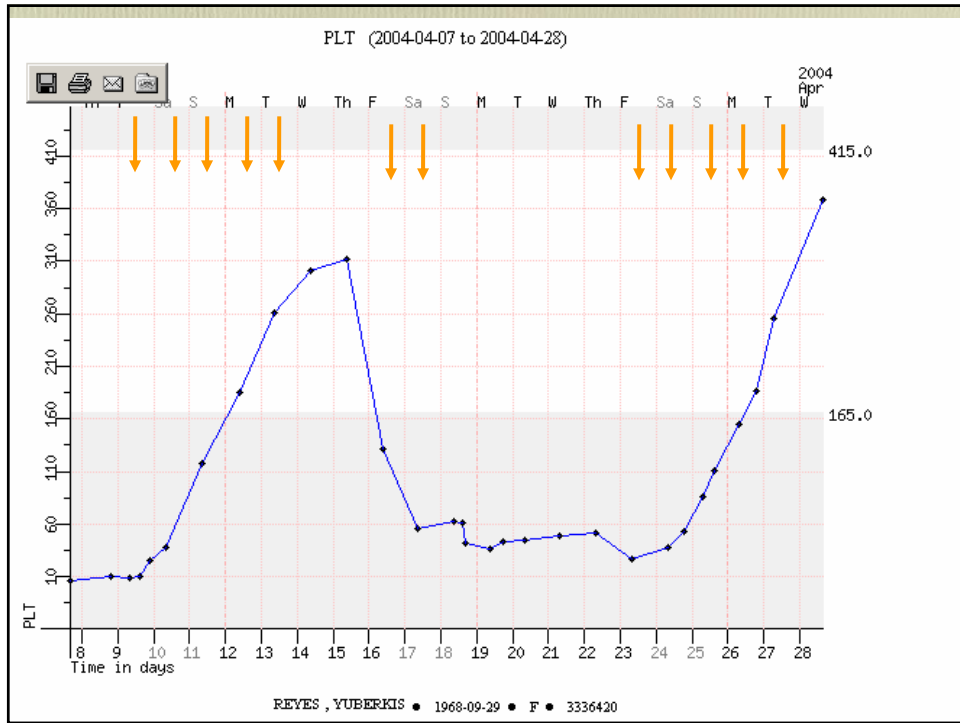

Case

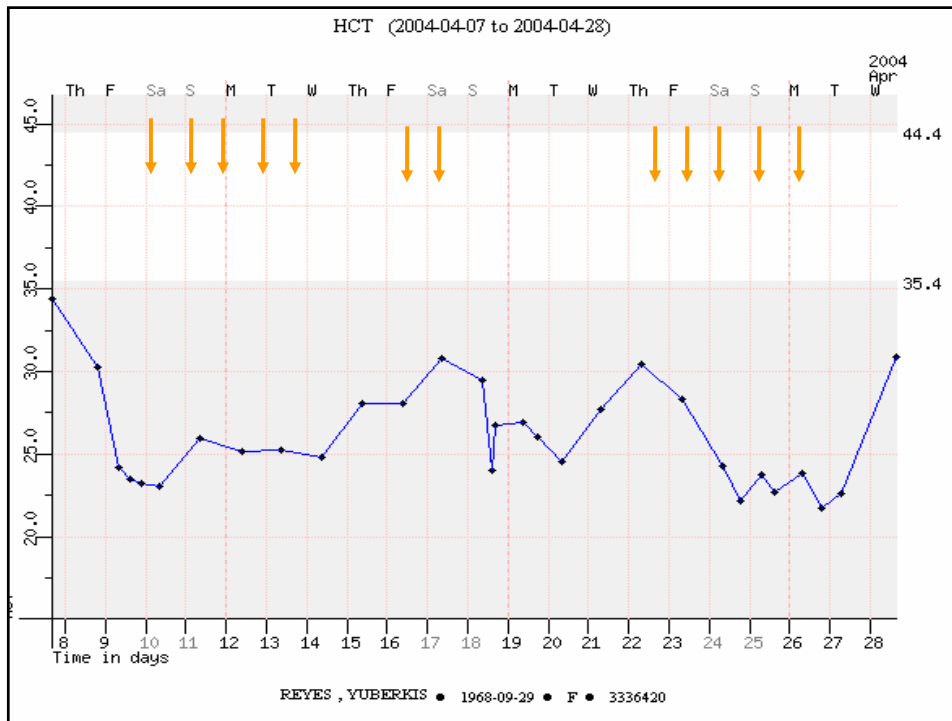

- 35 year-old F previously in good health, developed URI sx's 1 wk PTA. A few days later, felt "hot" with headache, and developed bruising on ant shins. Went to uricare, sent home. Then was called back for admission in the evening, due to PLT 5
- PE: T 99, VS stable, marked ecchymosis on B/L extremities, especially LE, a few on body.
- Lab:
 - PLT 5, WBC 7.7, H/H=11.3/ 34.3
 - PT/PTT 12.4/30.7, fib 327
 - TB/DB 2.6/0.4, AST/ ALT 65/ 13
 - BUN 11, Cr 0.5
 - Urine: hemoglobin 2+, RBC 15, WBC 0-2, Prot. neg
 - PB smear: schistocytes > 5/HPF
 - ANA, Speckled nuclearplasmic patterns
- DDx: ITP, HELLP, HUS,DIC, HITetc.

TTP In Brief

Pentad

- o Microangiopathic hemolytic anemia
 - (vessel narrowing) with schistocytes (mechanical injury to RBCs)
- o Severe Thrombocytopenia
 - o (systemic PLT aggregation)
- o Neurologic abnormalities
 - o (CNS ischemia)
- o Acute renal insufficiency
 - o (renal ischemia)
- o Fever
- o Associated with thrombosis
- o Plasmapheresis w FFP infusion
 - o Prednisone

Qualitative

- Inherited
 - Bernard-Soulier
 - Glanzmann's
 - Storage pool disease (Chediak-Higashi, Wiscott-Aldrich, Hermansky-Pudlak, Gray Platelet Syndrome)
- Acquired
 - Drugs (e.g. ASA, ADP, IIB/IIIa)
 - Uremia, Post-bypass
 - Primary marrow disorders; MDS, Dysproteinemias

Inherited

- Adhesion
 - Bernard-Soulier
- Aggregation
 - Glanzmann's
- Secretion
 - E.g. Gray Platelet Syndrome

Glanzmann's Thrombasthenia

- Rare Condition
- Inherited absence of GPIIb/IIIa (AR)
- Severe Bleeding manifestations
- GPIIb/IIIa a key platelet glycoprotein required for aggregation
- Absence of aggregation with ADP, Epi, Collagen
- Normal ristocetin

Bernard-Soulier

- Rare inherited bleeding disorder
- Lack of GPIb which is necessary for the formation of the hemostatic plug by binding to subendothelial von Willebrand factor
- Aggregation with ADP, Epi and collagen; absent ristocetin

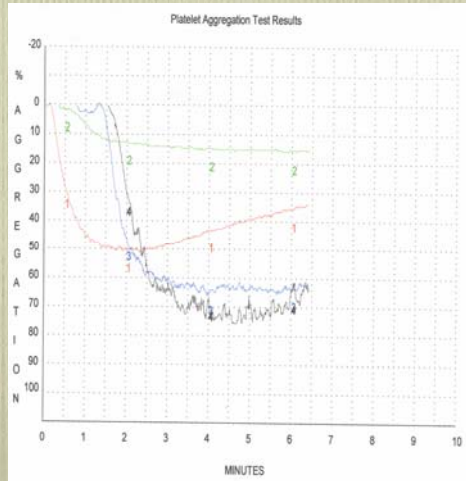

Thrombocytopathies

- Common
- Abnormality in the release reaction
- Storage Pool Disease (no ADP in granules)
- Release defect (defects in mechanism of release)
- Resembles same pattern as aspirin

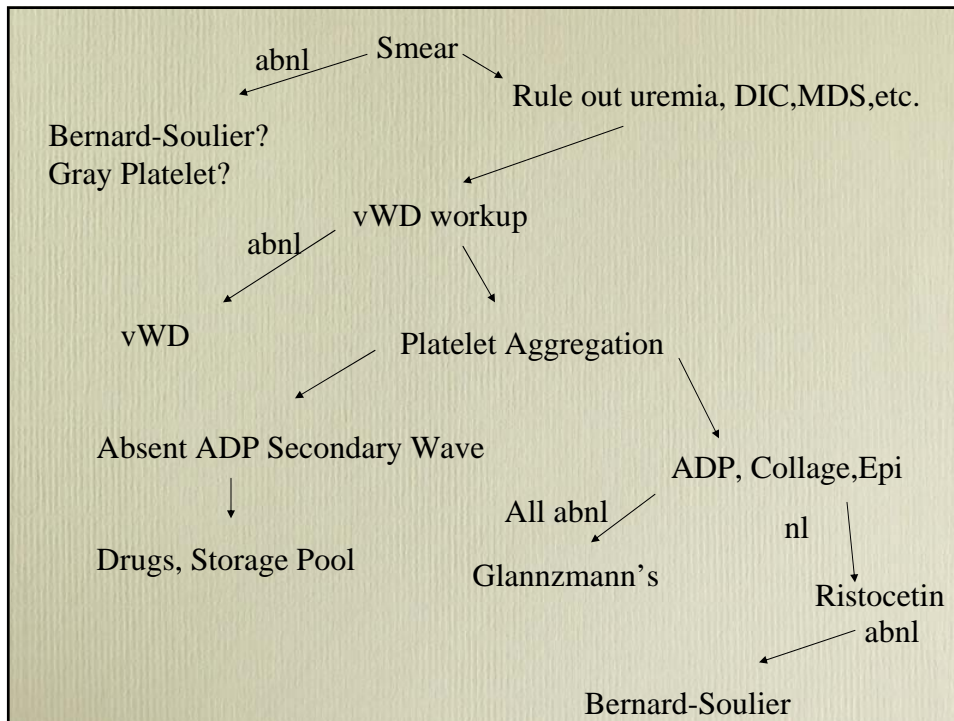

Hermansky-Pudlak

- 21 month old male with bruisability and bleeding
- albino features
- Oculomotor nystagmus
- Delayed development
- tyrosinase-positive oculocutaneous albinism (Ty-pos OCA), bleeding diathesis, and systemic complications associated to ceroid-lipofuscin-like lysosomal storage disease.

von Willebrand's Disease

- Inherited bleeding disorders
- Absent or decreased levels of vWf or lack of large and medium sized multimers
- Work up includes vWf:Ag level, FVIII:C activity, Ristocetin Cofactor Activity, Platelet Aggregation studies

Case

- 33 year old woman with menorrhagia
- History of epistaxis since childhood
- Cousin with similar problems
- Aspirin for headaches; no other meds
- PT, PTT, TT, Platelets normal count
- Blood smear platelet morphology normal

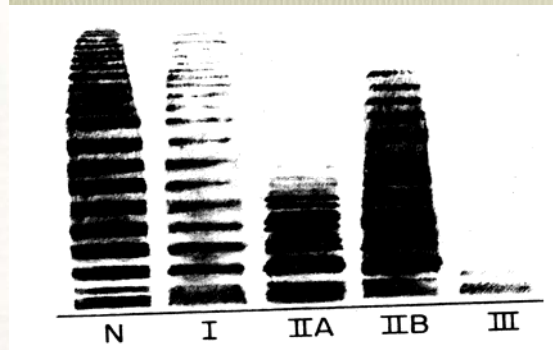

Differential Diagnosis

- Inherited
 - Bernard-Soulier
 - Glanzmann's
 - Storage Pool Defect
 - vWD
- Acquired
 - DIC, MDS, uremia, drugs, dysproteinemia

vWD Lab Workup

- Bleeding Time
- Ristocetin Cofactor (functional)
- Ristocetin Aggregation
- vWf Ag (quantitative)
- Factor VIII:C
- Multimeric Analysis

vWD

Type I vWD

- Most frequently encountered
- All polymeric forms are present, but to a decreased level
- Bleeding time usually prolonged; can be normal if mild deficiency

Type II vWD

- Type IIA
- Amount synthesized may be normal
- Failure to form intermediate or large multimers
- BT usually prolonged
- FVIII decreased or normal
- Type IIB
- Less common
- May not respond to DDAVP
- Largest multimers are absent
- Concentration too low to induce aggregation

Type III

- Severe bleeding disorder
- Very low levels of all multimers; low vWf:Ag, FVIII:C, Ristocetin Cofactor activity

Test	IA	IIA	IIB	III
BT	V	V	V	V
FVIII	D	D or N	D or N	D
vWAg	D	N or D	N or D	D
Rist Cof	D	D	D or N	D
Rist Aggr	D or N	D	I	D
Multimer	N	A	A	A
