

Finding Good Therapy Studies

Pyramid of Evidence

Number Needed To Treat (NNT)

- Inverse of the Absolute Risk Reduction
 - $NNT = 1/ARR$
- $ARR = \text{Control Event Rate} - \text{Experimental Event Rate (CER-EER)}$
 - Absolute difference between untreated and treated

Streptokinase/ASA in Acute MI

- No Tx 5-wk mortality from acute MI 13.5%
- Tx mortality 8%
- $ARR = 0.135 - 0.08 = 0.055$
- $NNT = 1 / 0.055 = 18$ patients
- Need to treat 18 patients to prevent one death

Some NNTs

*Table 3b3.2 Some NNTs for different treatments

Condition or disorder	Intervention	Events being prevented	Event Rates		Duration of follow-up	NNT to prevent one additional event
			Control Event Rate CER	Experimental Event Rate EER		
Diabetes (IDDM)*	Intensive insulin regimens	Diabetic neuropathy	0.096	0.028	6.5 years	15
Diabetes (NIDDM)†	Intensive insulin regimens	Worse diabetic retinopathy	0.38	0.13	6 years	4
		Nephropathy	0.30	0.10		5
Acute myocardial infarction‡	Streptokinase and Aspirin	Death at 5 weeks	0.134	0.081	5 weeks	19
		Death at 2 years	0.216	0.174	2 years	24
Diastolic blood pressure 115–129 mm Hg§	Antihypertensive drugs	Death, stroke or myocardial infarction	0.1286	0.0137	1.5 years	3
Diastolic blood pressure 90–109 mm Hg¶	Antihypertensive drugs	Death, stroke or myocardial infarction	0.0545	0.0467	5.5 years	128
Independent elderly people**	Comprehensive geriatric home assessment	Long-term nursing home admission	0.10	0.04	3 years	17

Pregnant women with eclampsia††	iv MgSO ₄ (vs. diazepam)	Recurrent convulsion	0.279	0.132	hours	7
Healthy women ages 50-69‡‡	Breast examination plus mammography	Death from breast cancer	0.00345	0.00252	9 years	1075
Symptomatic high-grade carotid artery stenosis§§	Carotid endarterectomy	Major stroke or death	0.181	0.08	2 years	10
Preterm babies¶¶	Antenatal corticosteroids	Respiratory distress syndrome	0.23	0.13	days	11

To find more examples, and to nominate additions to the databank of NNTs, refer to this textbook's Web Page at: <http://cebmlr2.ox.ac.uk/>
