Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

Consider a mathematical program of the following form

$$\begin{aligned} & \min c^T x \\ & \text{subject to } x \in S \cap P. \end{aligned}$$

$P := \{x \in \mathbb{R}^n \mid Ax \leq b\}$ is a polyhedral set, and $S \subset \mathbb{R}^n$ is a closed set.

Can we strengthen P with cuts?

Oracle-Based Cuts

Polynomial Optimization

Conclusion

Consider a mathematical program of the following form

$$\begin{aligned} \min \quad & c^T x \\ \text{subject to} \quad & x \in S \cap P. \end{aligned}$$

$P := \{x \in \mathbb{R}^n \mid Ax \leq b\}$ is a polyhedral set, and $S \subset \mathbb{R}^n$ is a closed set.

Can we strengthen P with cuts?

We shall focus on the geometric approach: cuts via S -free sets. (Many other ways to generate cuts, e.g. disjunctions, algebraic arguments, combinatorics, convex cuts, etc.)

Tightening P with an S -free set C

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

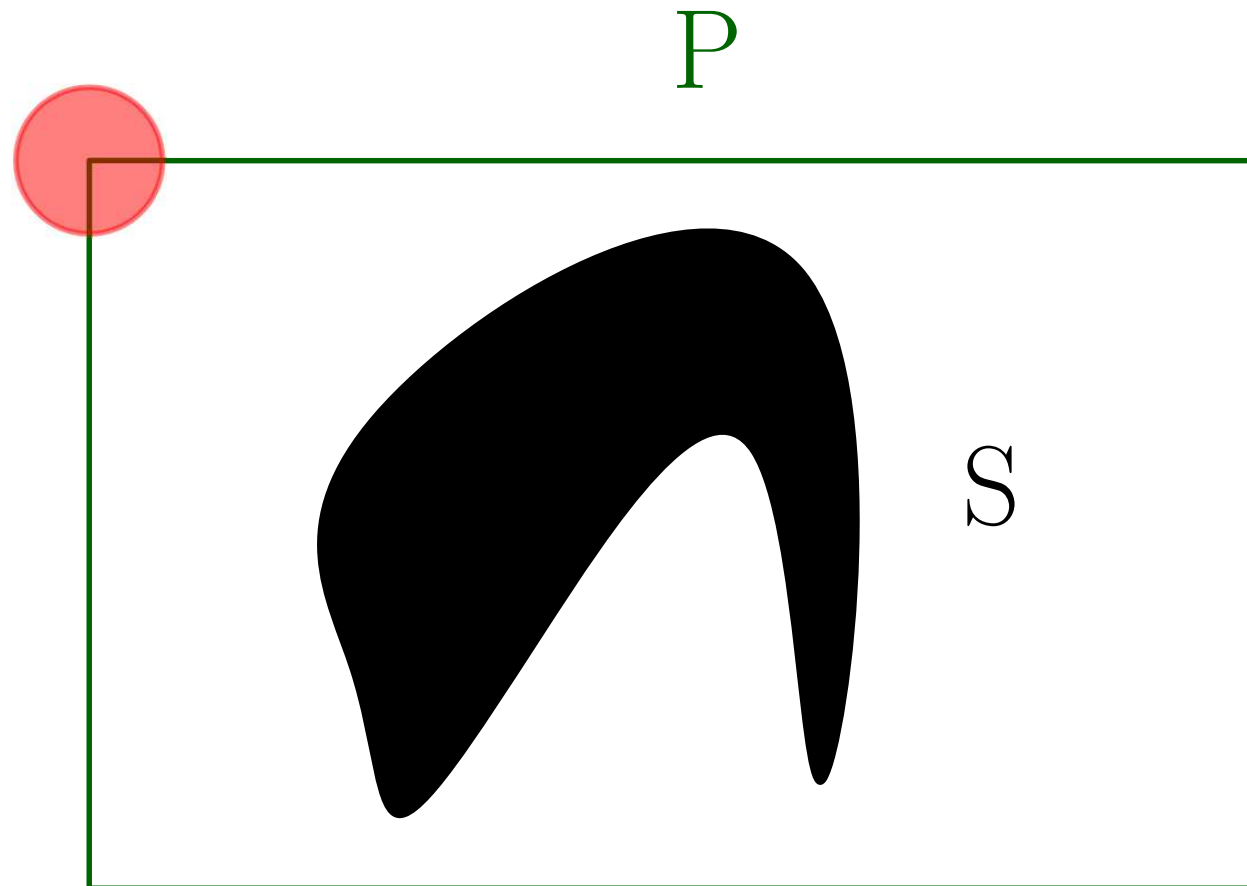

Additional Literature

Our Contributions

Oracle-Based Cuts

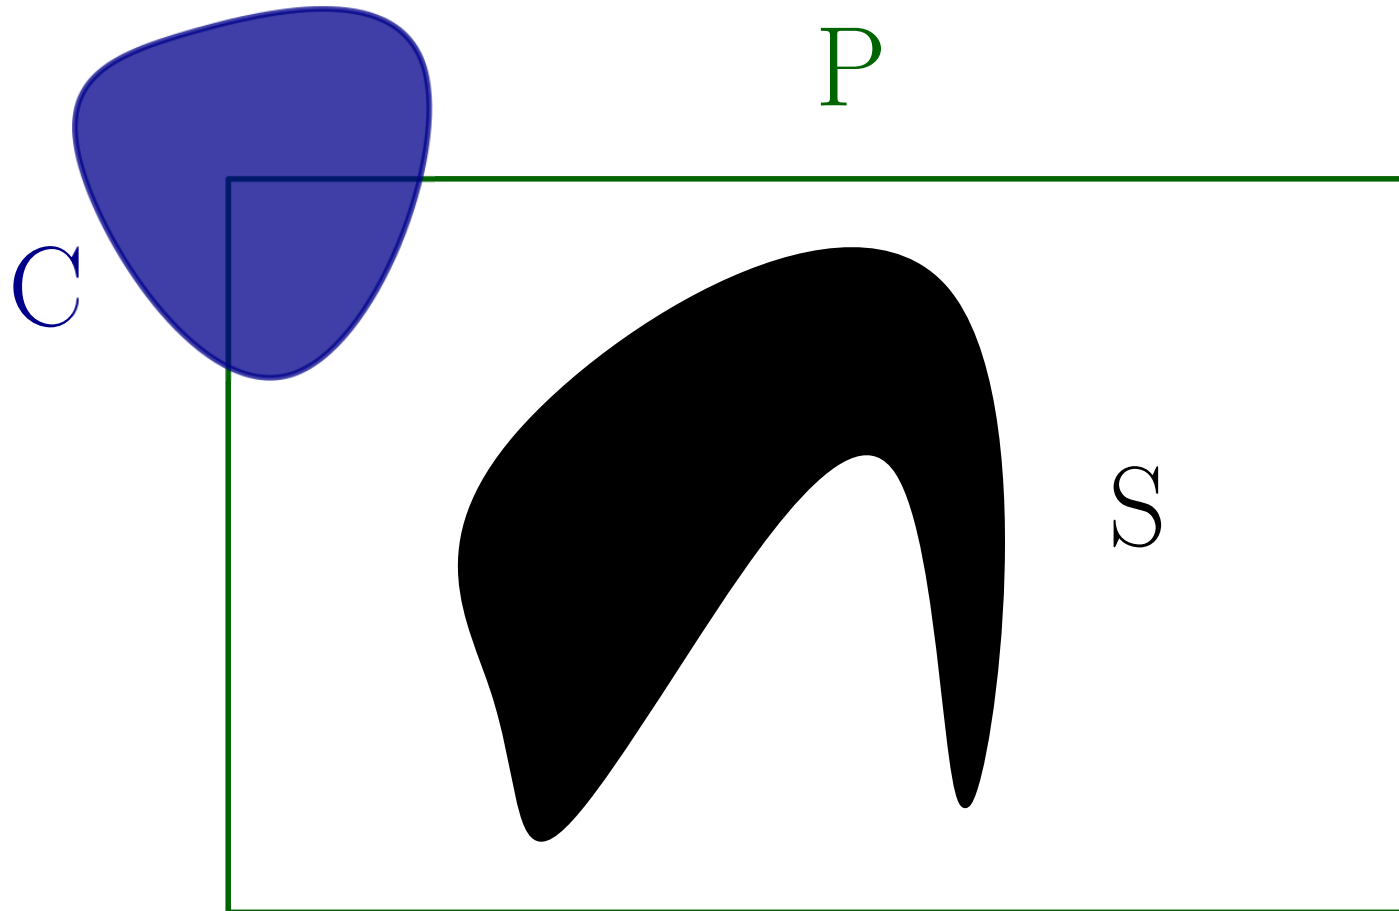

Polynomial Optimization

Conclusion

Let S be some closed set. Example: a rectangle P . Want to separate the extreme point marked with a red circle from S .

Tightening P with an S -free set C

C is an S -free set [Dey and Wolsey 2010]: a closed convex set with an interior that does not intersect with S .

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

Additional Literature

Oracle-Based Cuts

Polynomial Optimization

Conclusion

Tightening P with an S -free set C

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

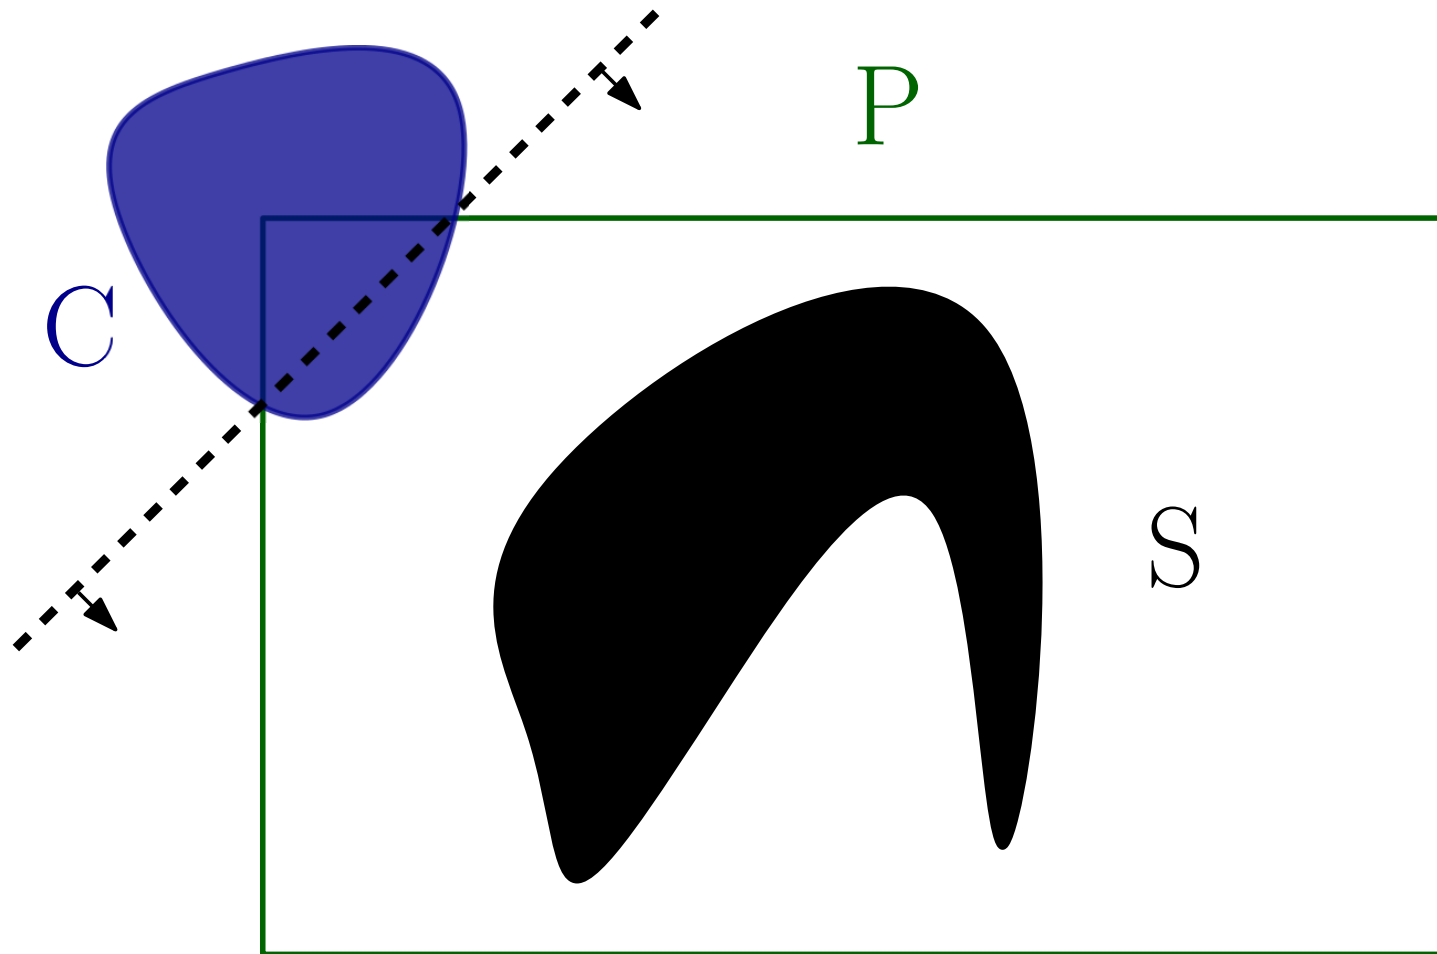

Additional Literature

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

We obtain a cut by subtracting C from P .

Tightening P with an S -free set C

$$\text{conv}(P \setminus \text{int}(C))$$

Applying the single cut gives us $\text{conv}(P \setminus C)$.

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

Additional Literature

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

Additional Literature

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

More than one cut, possibly an infinite number are needed. Separation is generally NP-Hard, e.g. P a polytope, C a ball models an NP-complete set containment problem.

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive) Additional Literature

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

Balas, 1971 (see also Tuy, 1964): If P is a simplicial cone then the intersection cut guarantees separation over $\text{conv}(P \setminus \text{int}(C))$

Simplicial cone: n linearly independent linear inequalities

Simplicial conic relaxation $P' \supseteq P$ is easily obtained from a basic solution of P

With less ambition we go for $\text{conv}(P' \setminus \text{int}(C))$

Intersection cut is described in closed form \rightarrow fast separation of extreme points of P using P'

Intersection cuts and maximal S -free sets

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

Additional Literature

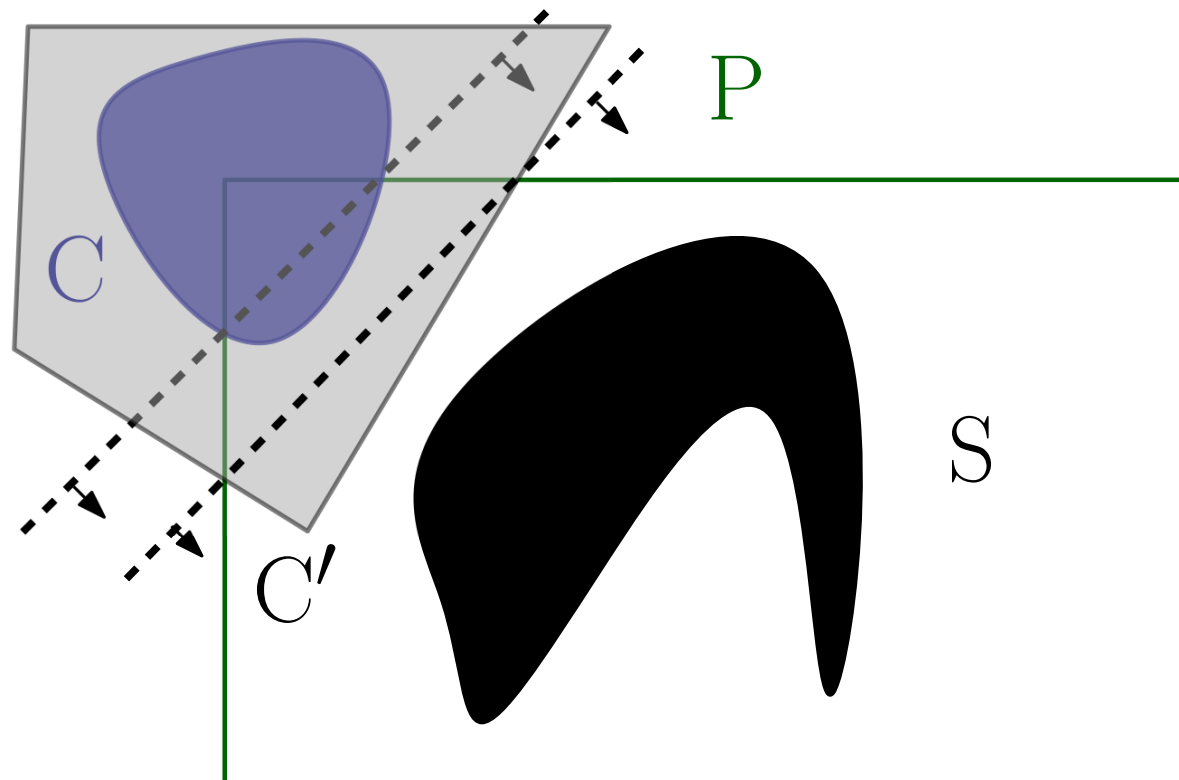

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

Bigger C , deeper cuts.

An S -free set C is *maximal* S -free if it is not contained in another S -free set.

(Non-Exhaustive) Additional Literature

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive) Additional Literature

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

Maximal S -free sets and minimal valid inequalities: [Basu et al. 2010], [Conforti et al. 2014], [Cornuejols, Wolsey, Yildiz, 2015], [Kilinc-Karzan 2015], etc.

Intersection cuts and for mixed-integer conic programs programming: [Atamturk and Narayanan 2010], [Belotti et al., 2013], [Andersen and Jensen, 2013], [Dadush, Dey, Vielma 2011], [Modaresi, Kilinc, Vielma 2015/2016], etc.

Intersection cuts for bilevel optimization: [Fischetti, Monaci, Sinni, 2016].

Generalized intersection cut procedures: [Balas and Margot, 2013], [Balas, Kazachkov, Margot 2016]

Our Contributions

Background

The Polyhedral Approach

Tightening P with an S -free set C

$\text{conv}(P \setminus \text{int}(C))$ is tricky

Intersection cuts and maximal S -free sets

(Non-Exhaustive)

Additional Literature

Our Contributions

Oracle-Based Cuts

Polynomial Optimization

Conclusion

- 1) A simple, generic way to generate S -free sets that ensures separation. Also, a corresponding cutting plane method for arbitrary closed sets, guaranteed to converge on bounded problems.
- 2) A study of maximal S -free sets for polynomial optimization

Polynomial Optimization

Conclusion

Suppose we have an oracle for a closed set S that gives us the distance $d(x, S)$ from any point $x \in \mathbb{R}^n$ to the nearest point in S .

Background

Oracle-Based Cuts

Distance Oracle

Cut Closure

Convergence

Polynomial Optimization

Conclusion

Suppose we have an oracle for a closed set S that gives us the distance $d(x, S)$ from any point $x \in \mathbb{R}^n$ to the nearest point in S .

Examples:

Integer programming: if S is the lattice, then one can round.

Polynomial optimization: distance can be calculated to arbitrary accuracy in polynomial time

Cardinality constraints: nearest vector of card (k) can be obtained by rounding.

Background

Oracle-Based Cuts

Distance Oracle

Cut Closure

Convergence

Polynomial Optimization

Conclusion

Suppose we have an oracle for a closed set S that gives us the distance $d(x, S)$ from any point $x \in \mathbb{R}^n$ to the nearest point in S .

Examples:

Integer programming: if S is the lattice, then one can round.

Polynomial optimization: distance can be calculated to arbitrary accuracy in polynomial time

Cardinality constraints: nearest vector of card (k) can be obtained by rounding.

Observation. The ball centered around x with radius $d(x, S)$ is S -free. Call it $\mathcal{B}(x, d(x, S))$.

We shall call the corresponding intersection cut an *oracle ball cut*.

Cut Closure Convergence

Background

Oracle-Based Cuts

Distance Oracle

Cut Closure

Convergence

Polynomial Optimization

Conclusion

Start with a polytope P_0 . Define P_{k+1} as P_k intersected with $\text{conv}(P_k \setminus \text{int}(\mathcal{B}(x, d(x, S))))$ for every extreme point x . This is the rank k *oracle cut closure*.

Cut Closure Convergence

Background

Oracle-Based Cuts

Distance Oracle

Cut Closure

Convergence

Polynomial Optimization

Conclusion

Start with a polytope P_0 . Define P_{k+1} as P_k intersected with $\text{conv}(P_k \setminus \text{int}(\mathcal{B}(x, d(x, S))))$ for every extreme point x . This is the rank k *oracle cut closure*.

Theorem: $\lim_{k \rightarrow \infty} P_k = \text{conv}(S \cap P)$.

Cut Closure Convergence

Background

Oracle-Based Cuts

Distance Oracle

Cut Closure

Convergence

Polynomial Optimization

Conclusion

Start with a polytope P_0 . Define P_{k+1} as P_k intersected with $\text{conv}(P_k \setminus \text{int}(\mathcal{B}(x, d(x, S))))$ for every extreme point x . This is the rank k *oracle cut closure*.

Theorem: $\lim_{k \rightarrow \infty} P_k = \text{conv}(S \cap P)$.

Corollary: given an inexact but arbitrarily accurate distance oracle, we can obtain arbitrarily close (in terms of Hausdorff distance) polyhedral approximation to $\text{conv}(S \cap P)$ in finite time. Borrows from proof technique used in [Averkov 2011].

Polynomial optimization can be formulated as

$$\begin{aligned} \min & \langle A_0, M \rangle \\ \text{s.t.} & \langle A_i, M \rangle \leq b_i, \quad i = 1, \dots, m. \end{aligned}$$

This is a linear programming relaxation with respect to M .

$\langle A_i, M \rangle := \sum a_{ij}m_{ij}$ is the inner product.

Equivalency when $M \succeq 0$, $\text{rank}(M) = 1$ and consistency constraints. Dropping the rank constraint gives the moment relaxation [Lasserre, *SIAMOPT* 2001].

Geometric notions are with respect to a vectorized space, e.g.

$$M \in \mathbb{S}^{2 \times 2} \rightarrow \{M_{11}, M_{12}, M_{22}\} \in \mathbb{R}^3$$

A convex set (in the appropriate vectorized space) is *outer-product-free* (OPF) if no point in the interior corresponds to a matrix that can be represented as an outer-product.
A set is maximal OPF if no OPF set strictly contains it.

Geometric notions are with respect to a vectorized space, e.g.

$$M \in \mathbb{S}^{2 \times 2} \rightarrow \{M_{11}, M_{12}, M_{22}\} \in \mathbb{R}^3$$

A convex set (in the appropriate vectorized space) is *outer-product-free* (OPF) if no point in the interior corresponds to a matrix that can be represented as an outer-product.

A set is maximal OPF if no OPF set strictly contains it.

It turns out OPF sets can have nice structure and lead to easily generated intersection cuts.

Using a modification by Dax (2016) of the Eckart-Young-Mirksy theorem, we can find the nearest (by Frobenius norm) outer-product to a given matrix. This uses eigenvalues, and hence can be generated (to specified precision) in polynomial time.

Recall: we want every extreme point of our relaxation to be an outer-product, i.e. PSD and rank one.

Any non-PSD extreme point can be separated by the outer-approximation cuts $c^T M c \geq 0$.

Any PSD extreme point with rank greater than 1 can be separated by the intersection cut given by $\mathcal{C}_{i,j}$ for some i, j [Chen, Oren, Atamturk 2016].

The oracle cut can be strengthened by recentering the ball and taking the conic hull (complicated expression but computationally fast).

We introduced an oracle-based intersection cut for closed sets. Furthermore, we constructed a convergent cutting plane algorithm that uses this oracle to 'ping' the set S . All of this is done without using any explicit structure about S .

Outer-product-free sets provide a new way to generate cuts for polynomial optimization.

Thanks!
