## IEOR 3106: Introduction to Operations Research: Stochastic Models

Homework Assignment 2: Tuesday, September 10, 2013

## Due on Tuesday, September 17 before class; to be discussed at the recitation on Sunday, September 15, 4:00-6:00pm, in 303 Mudd.

More Probability Review: In the Ross textbook, Introduction to Probability Models, read Sections 3.1-3.5 up to (not including) Example 3.24 on p. 125 (up to Example 3.22 on p. 123 of the 9 th edition). To keep the reading under control, Examples 3.14-3.16 on pages 111-117 (Examples 3.13-3.15 on pages 110-116 of the 9th edition) can be omitted. (The rest of Chapter 3 has interesting material, but we will not cover it.) Problems from Chapter 3 of Ross, plus two extra ones. In all homework, show your work.

Problem 3.3
Problem 3.4
Problem 3.7
Problem 3.11
Problem 3.12
Problem 3.14
Problem 3.15
Problem 3.37
Problem 3.40 (a)
Extra Problem 1. Suppose that you flip a fair coin $1,000,000$ times. What is the approximate probability of getting more than 501,500 heads?

Extra Problem 2. Suppose that you own shares of stock in the company Lewser, Inc. Suppose that the current (initial) stock price is $\$ 100$ per share. Suppose that we regard the daily changes in stock price as independent and identically distributed random variables (a simple additive random walk model). Suppose that the expected daily change is $-\$ 0.10$ or -10 cents per day (as one would expect from a stock with that name). Using units of dollars, suppose that the variance of the daily change is 0.25 . What is the approximate probability that the stock price has not dropped (is at least $\$ 100$ ) after 100 days?
