## Set-valued Approximations for Queues

Yan Chen

Columbia University, IEOR Department
Joint work with Ward Whitt
Columbia University, IEOR Department

## Motivation

Queueing performance under partial information:

- Queueing Network Analyzer (Whitt (1983))
- Approximations for GI/GI/K Queues (Whitt (1993))

Given partial information (first two moments),

$$
\mathbb{E}[W] \approx \frac{\rho^{2}\left(c_{a}^{2}+c_{s}^{2}\right)}{2(1-\rho)}
$$

Research Question:

- Approximations $\approx$ True Solutions ? (simulation is limited to check)
- Design high quality approximations under partial information

## Motivation

$G I / G I / 1$ Queues: mean 1 inter-arrival, mean $\rho$ service with scv $c_{a}^{2}$ and $c_{s}^{2}$. Range of $\mathrm{GI} / \mathrm{GI} / 1$ queues: Tight $\mathrm{LB}<\mathrm{HTA}<$ Daley UB

$$
\frac{\left(\left(1+c_{s}^{2}\right) \rho^{2}-\rho\right)^{+}}{2(1-\rho)}<\frac{\rho^{2}\left(c_{a}^{2}+c_{s}^{2}\right)}{2(1-\rho)}<\frac{\rho^{2}\left(\left[(2-\rho) c_{a}^{2} / \rho\right]+c_{s}^{2}\right)}{2(1-\rho)} .
$$

Question: How accurate the HTA is for fixed $\rho$ ?
Table 1: A comparison of bounds and approximations for the steady-state mean $E[W]$ as a function of $\rho$ for the case $c_{a}^{2}=c_{s}^{2}=4.0$

| $\rho$ | Tight LB | HTA | Tight UB | conj UB | $\delta$ | MRE | Daley | Kingman |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.30 | 0.107 | 0.514 | 1.499 | 1.508 | 0.041 | $0.60 \%$ | 1.714 | 3.114 |
| 0.50 | 0.750 | 2.000 | 3.470 | 3.510 | 0.203 | $1.15 \%$ | 4.000 | 5.000 |
| 0.70 | 2.917 | 6.533 | 8.441 | 8.520 | 0.467 | $0.93 \%$ | 9.333 | 9.933 |
| 0.90 | 15.750 | 32.400 | 34.21 | 34.843 | 0.807 | $0.35 \%$ | 36.000 | 36.200 |
| 0.95 | 35.625 | 72.200 | 74.621 | 74.755 | 0.902 | $0.18 \%$ | 76.000 | 76.100 |
| 0.98 | 95.550 | 192.080 | 194.557 | 194.702 | 0.960 | $0.07 \%$ | 196.000 | 196.000 |
| 0.99 | 195.525 | 392.040 | 394.533 | 394.684 | 0.980 | $0.04 \%$ | 396.000 | 396.020 |

(Chen and Whitt (2018) reviewed in Operations Research)

## Motivation

We expect to have high-quality set-valued approx [lowervalue, uppervalue]:

$$
\text { lowervalue }<\text { truesolutions }<\text { uppervalue. }
$$

Lower value and upper value are not far way from true solution:

$$
\begin{aligned}
& \text { lowervalue } \approx 0.85 \times \text { truesolutions } \\
& \text { uppervalue } \approx 1.15 \times \text { truesolutions }
\end{aligned}
$$

Research Goal: How to generate good ranges without knowing true solutions under partial information?

## Methodology

- 1. Input Data from Service Models
- 2. Extract Key Information
- 3. Apply "New Approach" beyond Two Moment Approximations
- 4. Create Set-valued Approximation

Several Questions:

- What are key information from queueing models?
- What is the "New Approach" ?
- How to create the approximations ?

## Relate to Decay Rates

$F \sim$ inter-arrival time cdf, $G \sim$ service time cdf.

- Decay rate $\theta_{W} \equiv-\lim _{x \rightarrow \infty} \log (P(W(F, G)>x)) / x$ :

$$
P(W(F, G)>t) \sim \alpha e^{-\theta w t} \text { as } t \rightarrow \infty
$$

- Given $\hat{f}(s), \hat{g}(s)$ are LT transforms of $F$ and $G, \theta_{W}$ is also the root of the equation

$$
\hat{f}(s) \hat{g}(-s)=1
$$

- $\mathrm{M} / \mathrm{M} / 1: \theta_{W}=(1-\rho) / \rho, \mathrm{GI} / \mathrm{GI} / 1: \theta_{W} \approx 2(1-\rho) /\left(\rho\left(c_{a}^{2}+c_{s}^{2}\right)\right)$.
(i) There is a precise theory that applies to a very large class of $\mathrm{GI} / \mathrm{GI} / \mathrm{K}$ queues.
(ii) Under regularity conditions the decay rate arises as the minimum positive root of the equation.

## Methodology

Motivated by the asymptotic tail behavior,

$$
P(W>t) \sim \alpha e^{-\theta w t} \text { as } t \rightarrow \infty .
$$

We optimize $\theta_{W}$ under partial information:

$$
\max \backslash \min \left\{\theta_{W}: F, G \text { have partial information }\right\} .
$$

The extremal models are used to construct set-valued approximations:

$$
E\left[W\left(F^{*}(U B), G^{*}(U B)\right)\right] \leq \text { truesolution } \leq E\left[W\left(F^{*}(L B), G^{*}(L B)\right)\right]
$$

## Tcheycheff Systems

## Definition

( $T$ System) The set of functions $\left\{u_{i}(t): 0 \leq i \leq n\right\}$ constitutes a $T$ system if the $(n+1)^{\text {st }}$-order determinant of the $(n+1) \times(n+1)$ matrix formed by $u_{i}\left(t_{j}\right), 0 \leq i \leq n$ and $0 \leq j \leq n$, is strictly positive for all $a \leq t_{0}<t_{1}<\cdots<t_{n} \leq b$.

Example: $\left\{1, t, t^{2},-\exp (-s t)\right\}$, check the determinant of

$$
\left[\begin{array}{cccc}
1 & 1 & 1 & 1 \\
t_{1} & t_{2} & t_{3} & t_{4} \\
t_{1}^{2} & t_{2}^{2} & t_{3}^{2} & t_{4}^{2} \\
-\exp \left(-s t_{1}\right) & -\exp \left(-s t_{2}\right) & -\exp \left(-s t_{3}\right) & -\exp \left(-s t_{4}\right)
\end{array}\right]
$$

under any $a \leq t_{1}<t_{2}<t_{3}<t_{4} \leq b$ is strictly positive.

## Use Wronskian to Check T-systems

## Theorem

If the Wronskian Matrix is positive definite, the system is $T$-system.
Example: $\left\{1, t, t^{2},-\exp (-s t)\right\}$ : write down Wronskian

$$
\left[\begin{array}{cccc}
1 & t & t^{2} & -\exp (-s t) \\
0 & 1 & 2 t & s \exp (-s t) \\
0 & 0 & 2 & -s^{2} \exp (-s t) \\
0 & 0 & 0 & s^{3} \exp (-s t)
\end{array}\right]
$$

Wronskian is positive definite $\Rightarrow \mathrm{T}$-system.

## Tcheycheff Systems (Informal Theorem)

Solve Partial Information Optimization (POPT):

$$
\max \backslash \min \left\{\theta_{W}: F, G \text { have partial information }\right\} .
$$

First Step: choosing proper large $M_{a}, M_{s}$ for original $F$ and $G(\varepsilon \approx 0.001)$.
$P\left(U>M_{a} \mathbb{E}[U]\right)=P\left(U>M_{a}\right)=P\left(V>M_{s} \mathbb{E}[V]\right)=P\left(V>\rho M_{s}\right)=\epsilon$
Examples: $\theta_{V}=\lim _{x \rightarrow \infty} \log (P(V>x)) / x$.

- $M: P\left(V>M_{s} \mathbb{E}[V) \approx \exp \left(-\theta_{V} M_{s}\right), \theta_{V}=1 / \rho\right.$.
- $H_{2}: P\left(V>M_{s} \mathbb{E}[V]\right) \approx \exp \left(-\theta_{V} M_{s}\right), \theta_{V}=1-\sqrt{\left(c_{s}^{2}-1\right) /\left(c_{s}^{2}+1\right)}$

Pick $\varepsilon=0.001, M_{s}=7,9$ for $M$ and $M_{s}=31.1,39.9$ for $H_{2}$.

## Applying Tcheycheff Systems

Partial information is the two moments of $F$, solve POPT

$$
\begin{array}{ll}
\max \backslash \min & \int_{0}^{M_{a}} \exp (-s t) d F(t) \\
\text { subject to } & \int_{0}^{M_{a}} d F(t)=1, \int_{0}^{M_{a}} t d F(t)=1, \int_{0}^{M_{a}} t^{2} d F(t)=\left(1+c_{a}^{2}\right)
\end{array}
$$

## Theorem

If $\left\{1, t, t^{2}\right\}$ is a $T$-system and if $\left\{1, t, t^{2},-\exp (-s t)\right\}$ for some $s>0$ is a $T$-system, the optimum (maximization, minimization) are unique and they are specific 2-point distributions $\left(F_{0}, F_{u}\right)$ for any $M_{a}>1+c_{a}^{2}$.

## Extremal Theorem for Decay Rates

$F_{0}$ : one at 0 , one at $\left(0, M_{a}\right), F_{u}$ : one at $\left(0, M_{a}\right)$ and one at $M_{a}$, meet the first two moments 1 and $1+c_{a}^{2}$. (similar for $G_{0}, G_{u}$ )

## Theorem

Let $F_{0}, F_{u}, G_{0}$ and $G_{u}$ be the two-point extremal cdf's for the $G I / G I / 1$ queue defined above.
For all $F \in \mathcal{P}_{a, 2}\left(1, c_{a}^{2}+1, M_{a}\right)$ and $G \in \mathcal{P}_{s, 2}\left(\rho, \rho^{2}\left(c_{s}^{2}+1, M_{s}\right)\right)$,

$$
\theta_{W}\left(F_{0}, G_{u}\right) \leq \theta_{W}(F, G) \leq \theta_{W}\left(F_{u}, G_{0}\right)
$$

## The First Set-valued Approximations

Table 2: Evaluation of $\mathbb{E}[W]$ for $F_{u} / G_{0} / 1$ and $F_{0} / G_{u} / 1$ with $\left(M_{a}, M_{s}\right)$

|  | $\rho$ | Tight LB | $M_{a}=9$ | $M_{a}=7$ | HTA | $M_{s}=7$ | $M_{s}=9$ | Tight UB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $c_{a}^{2}=c_{s}^{2}=1$ | 0.50 | 0.000 | 0.122 | 0.162 | 0.500 | 0.810 | 0.821 | 0.846 |
|  | 0.70 | 0.467 | 0.970 | 1.130 | 1.633 | 2.025 | 2.036 | 2.071 |
|  | 0.90 | 3.600 | 7.265 | 7.596 | 8.100 | 8.564 | 8.579 | 8.620 |
|  | $\rho$ | Tight LB | $M_{a}=39.9$ | $M_{a}=31.1$ | HTA | $M_{s}=31.1$ | $M_{s}=39.9$ | Tight UB |
| $c_{a}^{2}=c_{s}^{2}=4$ | 0.50 | 0.750 | 1.013 | 1.097 | 2.000 | 3.419 | 3.430 | 3.470 |
|  | 0.70 | 2.917 | 4.303 | 4.748 | 6.533 | 8.384 | 8.394 | 8.441 |
|  | 0.90 | 15.750 | 28.924 | 30.239 | 32.400 | 34.658 | 34.671 | 34.721 |

## More Partial Information

- Third moments for inter-arrival and service distribution
- Typical values of Laplace transforms

$$
\hat{f}(s), s=\mu_{a}>0,1 / \hat{g}(-s), s=\mu_{s}, 0<\mu_{s}<s^{*}
$$

$s^{*}$ is the first singularity of mgf of $G$.

## Theorem

Let $F_{L}, F_{U}, G_{L}$ and $G_{U}$ be the three-point extremal cdf's for the $G I / G I / 1$.
For $F \in \mathcal{P}_{a, 2}\left(1, c_{a}^{2}+1, m_{a, 3}, \mu_{a}, M_{a}\right), G \in \mathcal{P}_{s, 2}\left(\rho, \rho^{2}\left(c_{s}^{2}+1\right), m_{s, 3}, \mu_{s}, M_{s}\right)$, the following four pairs of lower and upper bounds for $\theta_{w}(F, G)$ are valid ( $\mu_{a}, \mu_{s}>0$ ):
(i) $\theta_{W}\left(F_{L}, G_{U}\right) \leq \theta_{W}(F, G) \leq \theta_{W}\left(F_{U}, G_{L}\right)$ if $\mu_{s}, \mu_{s} \leq \theta_{W}$
(ii) $\theta_{w}\left(F_{U}, G_{U}\right) \leq \theta_{W}(F, G) \leq \theta_{w}\left(F_{L}, G_{L}\right)$ if $\mu_{s} \leq \theta_{W} \leq \mu_{a}$
(iii) $\theta_{W}\left(F_{U}, G_{L}\right) \leq \theta_{W}(F, G) \leq \theta_{W}\left(F_{L}, G_{U}\right)$ if $\theta_{W} \leq \mu_{s}, \mu_{a}, \mu_{s}<s^{*}$
(iv) $\theta_{w}\left(F_{L}, G_{L}\right) \leq \theta_{w}(F, G) \leq \theta_{w}\left(F_{U}, G_{U}\right)$ if $\mu_{a} \leq \theta_{W} \leq \mu_{s}<s^{*}$.

## $M / M / 1$ Example

- (i) $\mu_{a}, \mu_{s} \leq \theta_{W}$, (ii) $\mu_{s} \leq \theta_{W} \leq \mu_{a}$
- (iii) $\mu_{\mathrm{a}}, \mu_{s} \geq \theta_{W}, \mu_{s}<s^{*}$, (iv) $\mu_{\mathrm{a}} \leq \theta_{W} \leq \mu_{s}<s^{*}$

We use $\mu=\theta_{W} / R$ or $\mu=\theta_{W} R$ for $R=5,10,20$.

Table 3: Bounds for $\theta_{W}$ (exact) and $E[W]$ (approximate) for $\rho=0.7$ and $c_{a}^{2}=c_{s}^{2}=1$ based on $M / M / 1$ (For reference, exact values for $M / M / 1$ are $\theta_{W}=(1-\rho) / \rho=0.4286$ and $\left.E[W]=\rho^{2} /(1-\rho)=1.63\right)$

| case | $\theta_{W}$ |  |  | $E[W$ |  |  |  | case | $\theta_{W}$ |  |  | $E[W]$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $R=5$ | 10 | 20 | $R=5$ | 10 | 20 |  | $R=5$ | 10 | 20 | $R=5$ | 10 | 20 |  |
| (i) | 0.426 | 0.425 | 0.425 | 1.67 | 1.67 | 1.68 | (ii) | 0.421 | 0.418 | 0.415 | 1.59 | 1.62 | 1.68 |  |
|  | 0.432 | 0.432 | 0.439 | 1.65 | 1.65 | 1.56 |  | 0.434 | 0.437 | 0.446 | 1.53 | 1.56 | 1.61 |  |
| (iii) | 0.422 | 0.417 | 0.409 | 1.71 | 1.72 | 1.71 | (iv) | 0.426 | 0.424 | 0.418 | 1.61 | 1.60 | 1.57 |  |
|  | 0.434 | 0.436 | 0.436 | 1.65 | 1.63 | 1.62 |  | 0.431 | 0.432 | 0.429 | 1.60 | 1.61 | 1.63 |  |

## Set-valued Approximations for $G I / G I / K$

We extend the approach to $G I / G I / K$ models via using decay rate $\theta_{W}$ is same as that in $G I / G I / 1$ models.

Table 4: The set-valued approximations for $E[W]$ in $G I / G I / 2$ for $\rho \in\{0.5,0.7,0.9\}$ and $R \in\{5,10,20\}$

| $\rho=0.5$ | $c_{a}^{2}=c_{s}^{2}=1$ |  |  | $\rho=0.7$ | $c_{a}^{2}=c_{s}^{2}=1$ |  |  | $\rho=0.9$ | $c_{a}^{2}=c_{s}^{2}=1$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $R$ | 5 | 10 | 20 | $R$ | 5 | 10 | 20 | $R$ | 5 | 10 | 20 |
| UB | 0.353 | 0.405 | 0.427 | UB | 1.34 | 1.39 | 1.41 | UB | 7.69 | 7.69 | 7.71 |
| LB | 0.290 | 0.262 | 0.251 | LB | 1.30 | 1.31 | 1.33 | LB | 7.67 | 7.62 | 7.61 |
| $\overline{\rho=0.5}$ | $c_{a}^{2}=c_{s}^{2}=4$ |  |  | $\rho=0.7$ | $c_{a}^{2}=c_{s}^{2}=4$ |  |  | $\rho=0.9$ | $c_{a}^{2}=c_{s}^{2}=4$ |  |  |
| $R$ | 5 | 10 | 20 | $R$ | 5 | 10 | 20 | $R$ | 5 | 10 | 20 |
| UB | 1.34 | 1.44 | 1.68 | UB | 5.29 | 5.37 | 5.76 | UB | 30.6 | 30.4 | 31.6 |
| LB | 1.30 | 1.27 | 1.21 | LB | 5.58 | 5.54 | 5.49 | LB | 30.9 | 30.7 | 30.8 |

Exact Solutions: $E[W(M, M)]=0.333,1.345,7.67$ under $\rho=0.5,0.7,0.9$.

## Summary

A new performance analysis method for $G I / G I / K$ models:

- Truncate unknown models by setting proper $M_{a}, M_{s}$
- Solve optimizations for decay rates to determine extremal distributions
- Simulate extremal models to obtain the set-valued approximations

Under partial information: set-valued approximations such that

$$
\text { lowervalue } \leq \text { truesolutions } \leq \text { uppervalue. }
$$

## Thank You!
