masses. This appears to be structurally similar to Stromatopora bed 3 at Becraft mountain. Weller also notes the occurrence of Stromatoporoid masses over 30 feet beneath the Favosites bed. Lower Manlius. 5 feet

Fig Finely grained limestone. Lower Manlius. 1 foot

F1d Lower 2 inches are a finely grained limestone, the rest is coarse. Both portions contain Spirifer vanuxemi Hall and Beyrichia manliusensis Weller in abundance. Lepidodita alta Conrad and Loxonema sp. were occasionally found. Lower Manlius. 1 foot

F1e Very finely grained blue limestone, in which Spirifer vanuxemi Hall is very abundant. A few specimens of Lepidodita alta Conrad were also found. Lower Manlius. 1 foot

F1f Alternately fine and coarse grained blue limestone inclosing some shale bands. The following species, but not in abundance, were found here. Lower Manlius. 32 inches

86 Spirifer vanuxemi Hall 116 Loxonema sp.
89 Strophoedonta varistriata? (Conrad) 144 Beyrichia manliusensis? Weller
146 Lepidodita alta Conrad

Fig Dark blue limestone. Lower Manlius. 4 inches

F1h Light gray limestone with many specimens of Spirifer vanuxemi Hall and Strophoedonta varistriata (Conrad). No other fossils were noticed. Lower Manlius. 1 inch

F1k Dark gray limestone. No fossils found. 5 inches

F1l Dark blue limestone exceedingly full of specimens of Spirifer vanuxemi Hall and Strophoedonta varistriata (Conrad). Lower Manlius. 2 inches

F1m Alternating finely and coarsely grained, dark blue limestone. It has many conspicuous shale seams. Lower Manlius. 4½ feet

The following fossils were collected:

86 Spirifer vanuxemi Hall C 128 Tentaculites gyracanthus (Eaton)
89 Strophoedonta varistriata (Conrad) r 144 Beyrichia manliusensis Weller r

Fin A finely crystalline, dark blue limestone with alternating shale seams. Five inches from the top is a 1 inch band of which
