3.0 Economies of Waste

4.0 Economies of Water

5.0 Economies of Energy

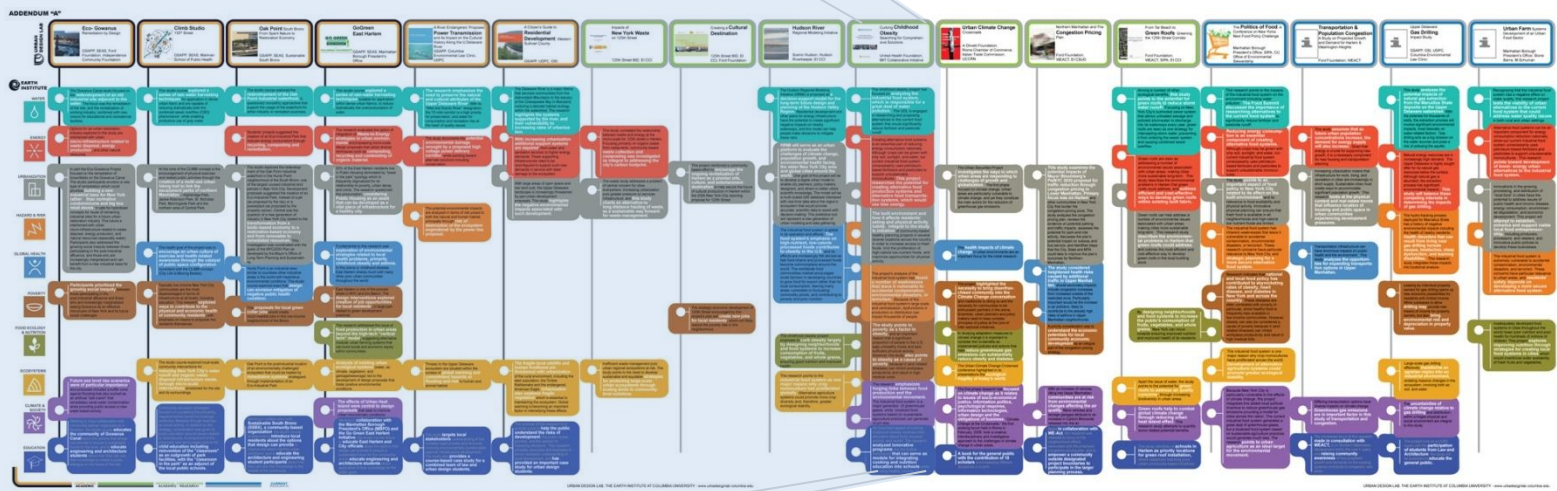

6.0 The Health Equation

Urban Design Lab- Project Matrix

Curbing **Childhood Obesity**
Searching for Comprehensive Solutions

United Health Foundation,
MIT Collaborative Initiative

- WATER**
The childhood obesity project has focused on analyzing the industrial food system, which is responsible for a great deal of water pollution. The UDL is engaged in researching and proposing alternatives to the current food system that would significantly reduce fertilizer and pesticide runoff.
- ENERGY**
This project researches the potential for creating alternative food production systems and alternative food transportation systems, which would use less energy.
- URBANIZATION**
The built environment and how it affects residents' eating and physical activity habits. Integral to the study is initiation of community-based healthy planning projects in several diverse locations across the country in order to increase access to fresh foods, limit the proliferation of high-calorie low-nutrient foods, and maximize opportunities for physical activity.
- HAZARD & RISK**
Because of the industrial food system's large scale and centralization, dysfunctions in production or distribution can impact thousands of people.
- GLOBAL HEALTH**
The worldwide food commodities market encourages small farmers in developing countries to grow food for export rather than for local consumption, leaving many areas vulnerable to fluctuating commodity prices, and contributing to poverty and poor nutrition.
- POVERTY**
The study points to poverty as a factor in obesity and to obesity as a cause of poverty because it (and related illnesses) can inhibit workplace productivity and result in high medical costs.
- FOOD ECOLOGY & NUTRITION**
The childhood obesity project proposes to curb obesity largely by designing neighborhoods and food systems to increase consumption of fruits, vegetables, and whole grains, ensuring good nutrition and improved health.
- ECOSYSTEMS**
The research points to the industrial food system as one major reason why crop monoculture has proliferated globally.
- CLIMATE & SOCIETY**
The research emphasizes forging links between food production and the environmental movement. The industrial food system is a major generator of greenhouse gases.
- EDUCATION**
An important aspect of curbing childhood obesity involves child education about food, physical activity, and health. The research analyzed innovative programs that can serve as models for integrating cooking and nutrition education into schools.

1.1 New Regional Paradigms

Description

A proposed density-saturation model for the long-term future design and planning of the Hudson Valley Region.

- CLIMATE & SOCIETY
- EDUCATION

The Hudson Regional Modeling Initiative (HRMI) is proposed as a decision-support model for the long-term future design and planning of the Hudson Valley Region. Residential development and other plans for energy infrastructure have the potential to create significant negative impacts on nearby waterways, and this model can help people make decisions to mitigate these risks.

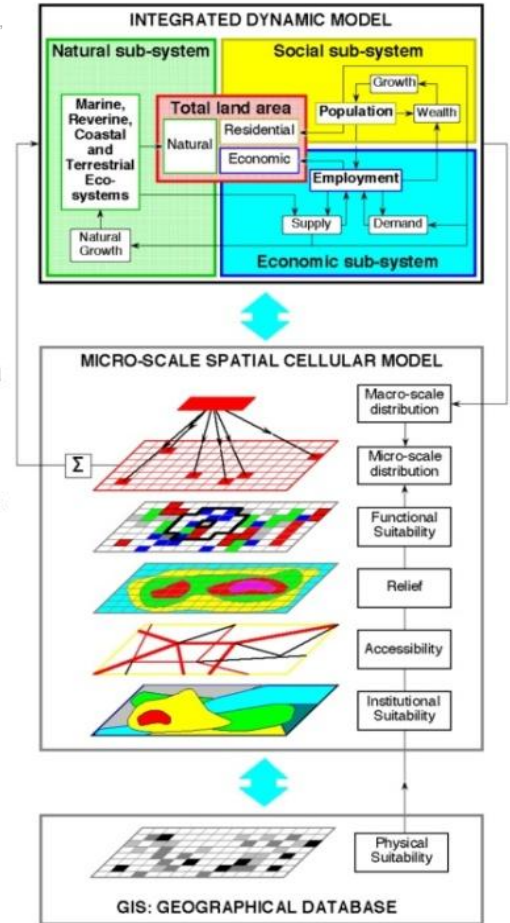

HRMI will serve as an urban platform to evaluate the challenges of climate change, population growth, and environmental health facing the wider New York City area and global cities around the world. The goal of this project will be to develop a digital urban model to enable city planners, policy makers, designers, and others to better utilize scientific knowledge. The model will be a multi-scaled GIS database interlaced with real-time data about the region's ecosystem that would provide accurate, scientific data to assist with decision-making. This predictive tool will represent a new generation of urban modeling and data gathering.

Law Clinic

- WATER**
This study analyzes the potential impacts of natural gas extraction from the Marcellus Shale deposits on the Upper Delaware watershed. With the potential for thousands of wells, the extraction process will involve significant environmental impacts, most basically on water-related factors. Gas drilling acts as a big stressor on the water sources and pose a risk of polluting the aquifer.
- ENERGY**
Natural energy resources are in increasingly high demand. The Upper Delaware is highly sought after for its natural gas resources below the surface. Although natural gas is abundant, the extraction process has significant environmental impacts. This study will balance these competing interests in determining the impacts of gas drilling.
- URBANIZATION**
The hydro-fracking process deployed for Marcellus Shale has a history of negative environmental impacts including the health of nearby residents. Health disorders that can result from living near gas drilling include nausea, headaches, sleep dysfunction, and learning disabilities. This research study integrates these impacts into locational analysis.
- HAZARD & RISK**
Leasing by individual property owners for gas drilling opens up new economic possibilities for residents with limited income. While subsidies to allow drilling may provide new means of income for property owners, but also bring environmental risk and depreciation in property value.
- GLOBAL HEALTH**
Large-scale gas drilling effectively transforms an agrarian region into an industrial environment, entailing massive changes in the ecosystem, involving both air, soil, and water.
- POVERTY**
The uncertainties of climate change relative to gas drilling and distribution within a fragile physical and social environment are integral to this study.
- FOOD ECOLOGY & NUTRITION**
The project runs as a COLEI (Columbia Open Space Institute) initiative, with the participation of students from Law and Architecture to educate the general public.

This study assumes that as future urban population concentrations increase, the demand for energy supply will also increase. Greenhouse energy is crucial for supporting new growth. It is a necessary component for new housing and transportation planning.

Increasing urbanization means that infrastructure for work, living, and recreation in cities are increasingly in short supply. Sustainable cities must create ways to accommodate significant population growth. This research looks at the physical context and real estate trends that influence location of housing and public space in urban communities experiencing development pressures.

Transportation infrastructure can have enormous impacts on public health and the environment. This study analyzes the opportunities for expanding transportation options in Upper Manhattan.

Differing transportation options have diverse impacts on climate change. Greenhouse gas emissions are an important factor in this study of transportation and congestion.

The immediate focus of this research, made in consultation with WEACT, is on Northern Manhattan where population is growing rapidly. Raising community awareness of how projected growth and demands on the existing systems contribute to congestion and urban

2.3 New Urban Paradigms

Sustainable urban waste infrastructure requires graduated scales such that long-distance disposal is not a requisite, and micro-scale systems can augment macro-scale. This study explored micro-scale innovation.

Emphasis was placed on developing strategies for productive use of organic waste for food production through innovation in urban composting techniques.

Inefficient waste management systems put urban regional ecosystems at risk. This study points to the need to develop sustainable and equitable strategies for protecting large-scale urban ecosystems through scaling down to community level solutions.

This studio worked in collaboration with the Columbia University Office of Environmental Stewardship to develop demonstration projects toward increasing public awareness of the efficiencies of micro-scale urban infrastructure.

2.4 New Urban Paradigms

Urban Fabric Upgrading Accra, Ghana

Description

Focus on provision of basic infrastructure need for the GaMashie and Nima communities within an overall context of **rapidly growing pressures for densification of the existing urban fabric.**

Collaboration

GSAPP, Urban Design Program
 GSAPP, Urban Planning Program
 Accra Metropolitan Assembly

Support

Millennium Cities Initiative, The Earth Institute
 CHF International

WATER

Provision of adequate domestic water infrastructure is a pressing needs within the Accra development context, together with adequate infrastructure for handling of storm water

ENERGY

URBANIZATION

Within the rapidly urbanizing context of Accra, Ga Mashie and Nima represent two aspects of the pressure for densification of older established formal and informal communities with unresolved questions related to overcrowding and displacement as well as basic spatial inadequacy of the dwellings and services

HAZARD & RISK

GLOBAL HEALTH

Provision of sanitation infrastructure is the single most important factor to improving public health conditions.

POVERTY

Accra poverty levels are consistent with developing urban economies in poor countries everywhere. The focus of the studies included encouraging the intense entrepreneurial activities from informal communities.

FOOD ECOLOGY & NUTRITION

ECOSYSTEMS

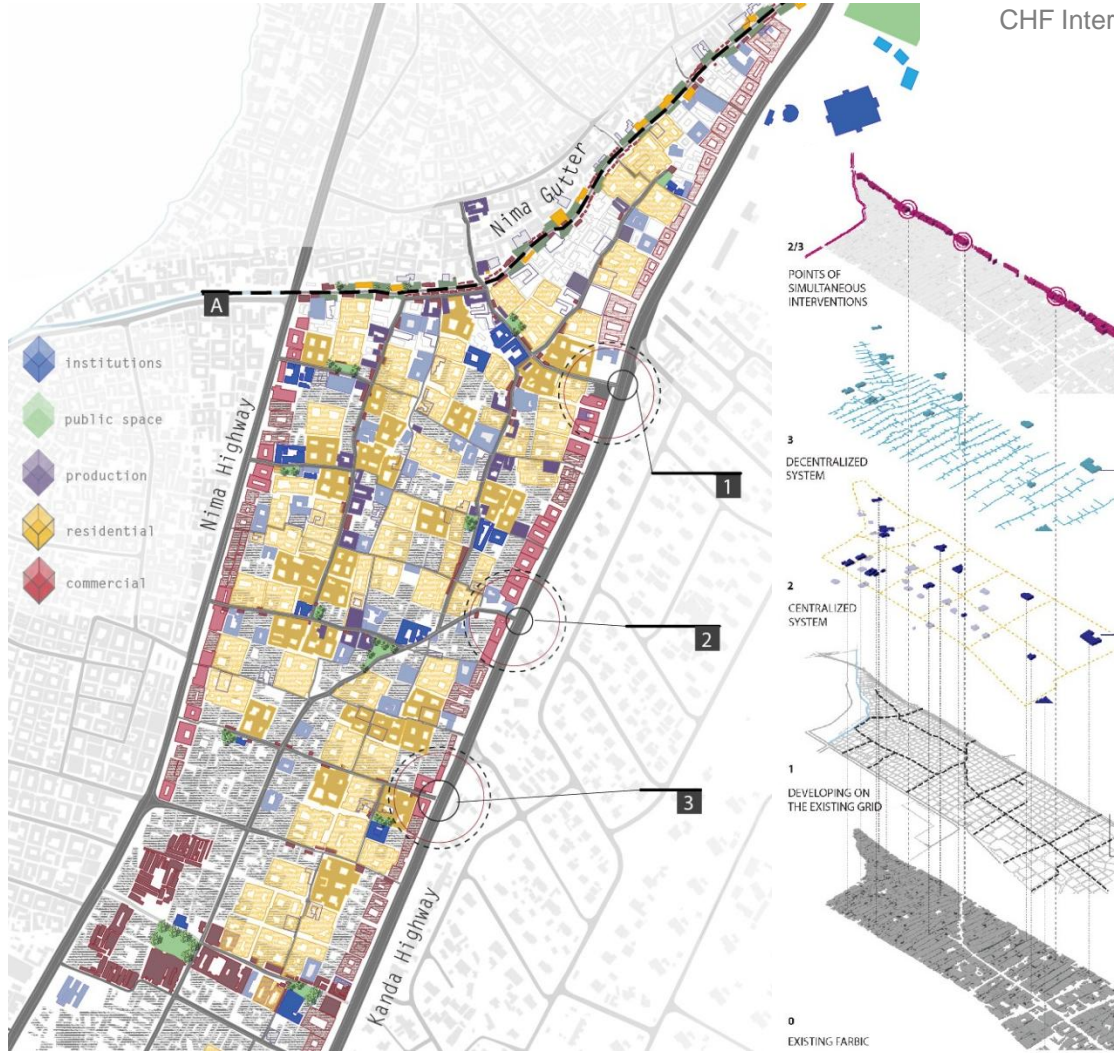

CLIMATE & SOCIETY

As a sea-level city in rapid development, Accra requires comprehensive climate-related responses in the retrofitting of its infrastructure

EDUCATION

A Commercial Corridor extension from Nima Market to Kanda Development
B Expansion of a Niche Manufacturing/ Commercial front along Kanda Highway
C Connect neighborhoods by turning 'Gutter' into a shared public space and pathway

A Anchoring around nodal points for the first step of incremental growth through constructing primary and emergency access
B Tapping into the strengths of Nima's youth group activities as well as the Red Cross Mother's Club that acts as a vital partnership & resource
C Road Access is a major concern of the residents in Nima, particularly in their optimism for change

A Lacking access to clean water and public restrooms is a tremendous burden for the inhabitants of Nima due to the lack of city provisions and the unequal distribution of their location
B There is no formal structure for sanitation collection which leads to unhygienic pollution affecting the health of Nima residents
C The dense fabric along with increasing encroachments make it difficult for emergency vehicles to pass, often resulting in patients being carried out by young men from the community

46% of households do not have a toilet facility. Of the 56% who do, only 20% have a proper toilet and use the bucket/pit system. 24%

One Gulin
One Gulin | x2 centers | x5 values | x9 districts

GULIN, CHINA 吉 茵

Vision
The New Gulin is envisaged to be a regenerative, harmonious, environmentally friendly and resource-efficient urban extension to the Old Gulin. While Gulin is not a city, Gulin can claim a status far transcendent in having environmental, cultural and energy conservation, and sustainable development. Gulin serves as a model for other cities in China.

While the New Town is being developed as a new center away from the Old Town, our approach is to plan its development as a strategic growth of the Old Town that respects the continuity of Gulin as a whole.

Our strategies and projects aim to mitigate risks and seize opportunities to be able to enable Gulin to be a sustainable city that respects the ecological and cultural heritage of the Old Town and the development of public green infrastructural systems and building typologies which are instrumental in mitigating social, economic, energy, ecological, and cultural risks that promote community interaction and cohesion.

Public green infrastructure such as water infrastructure for storm-water runoff treatment, flood-tap, and competing income opportunities to be developed as network of public spaces, like: habitats, horticulture, public facilities for education, research and healthcare, etc.

Values 价值

- Balance** Create a balance between Ecology, Economy & Experience
- Transfer** Learn the dichotomy between Rural & Urban, Urban & non-urban life
- Healthy** Promote resource rich diversity, resource rich diversity, rural and urban diversity, cultural diversity

Integration
Integrate natural system elements
Integrate ecological, economic & public service networks & programs

Resilience
Resilience to climate change
Resilience to economic & social of community
Threat program & risk management planning

Strategies 策略
mitigating risk & seizing opportunities

3.1 Economies of Waste

Description

Studio participants envisioned a continuity of use: from the present period of industrial abandonment to a phase of remediation, research and development, and then to a period of new industry driven by spin-offs from the remediation technology. This strategy prioritizes gaining a new “industrial” base for New York after many decades of neglect.

Collaboration

GSAPP, UDL
Columbia Engineering
Gowanus Canal Community Development Corporation

WATER

The Gowanus Canal study focused on the redevelopment of an old industrial site adjacent to the water. The focus was the remediation of the site, and the revitalization of working industry, combined with new visions for educational and recreational facilities.

ENERGY

Options for an urban restoration industry explored in this study are interwoven with urban micro-infrastructure related to waste disposal, energy production and other natural resources.

URBANIZATION

In part the Eco-Gowanus Project focused on the remediation of brownfields on the Gowanus Canal. The studio participants envision a new type of remediation which could produce building a new industrial base for New York rather than normative condominiums and big box retail stores. Several important concepts for reuse of remaining industrial sites for a future urban restoration industry. This future is interwoven with urban micro-infrastructure related to waste disposal, energy production, and natural resources (especially water).

HAZARD & RISK

Participants also addressed the growing social inequity between those participating in the post-industrial affluence, and those who are increasingly marginalized and can benefit from a new industrial base for the city.

GLOBAL HEALTH

POVERTY

Participants prioritized the growing social inequity between those participating in the post-industrial affluence and those who are increasingly marginalized, seeing Gowanus as an effective microcosm of New York and its future social challenges.

FOOD ECOLOGY & NUTRITION

ECOSYSTEMS

Future sea level rise scenarios were of particular importance and proposals included a buffer zone against flooding that also worked as an artificial “rain forest” that remediated canal water contamination while providing public access to new water-based activity.

CLIMATE & SOCIETY

EDUCATION

Working in close collaboration with community partners, participants focused on the education of the community of Gowanus Canal. They also focused on how to educate engineering and architecture students about how they can use their knowledge to create a public legacy on the future of the site.

3.2 Economies of Waste

3.3 Economies of Waste

New Restoration Economy: South Bronx

Description

A Design Studio that explored a **new generation of industry** in New York City related to the transformation from a biotic-based economy to a restoration-based economy and from renewable to remediated resources.

Collaboration

GSAPP
Columbia Engineering
Sustainable South Bronx (SSBX)

- WATER**
The studio course explored the redevelopment of the Oak Point industrial waterfront. It questioned monolithic approaches that support the usage of the waterfront for either industry or recreation purposes.
- ENERGY**
Students' projects suggested the creation of an Eco-Industrial Park that reduces energy consumption through recycling, composting and remediation.
- URBANIZATION**
The studio explored the redevelopment of the Oak Point industrial waterfront in the Hunts Point neighborhood of the South Bronx, one of the largest unused industrial land parcels in New York City. Development proposals suggested the creation of an Eco-Industrial Park, instead of a jail (as proposed by the city) or a powerplant (as proposed by the property owner). Central was the question of a new generation of industry in New York City related to the transformation from a biotic-based economy to a restoration-based economy and from renewable to remediated resources. This investigation was coordinated with the goals of the NYC2030 Plan as developed by the Mayor's Office of Long-Term Planning and Sustainability.
- HAZARD & RISK**
Hunts Point is an industrial area similar to countless other industrial areas in the world with hazardous environmental conditions. The studio course explored ways that design can envision mitigation of negative public health condition.
- GLOBAL HEALTH**
The proposals for local green collar jobs would create much-needed jobs in this low-income neighborhood of the Bronx.
- POVERTY**
The proposals for local green collar jobs would create much-needed jobs in this low-income neighborhood of the Bronx.
- FOOD ECOLOGY & NUTRITION**
The proposals for local green collar jobs would create much-needed jobs in this low-income neighborhood of the Bronx.
- ECOSYSTEMS**
Oak Point is the postindustrial location of an environmentally challenged ecosystem that could be healed by naturalistic systems strategized through implementation of an Eco-Industrial Park.
- CLIMATE & SOCIETY**
Working in collaboration with Sustainable South Bronx (SSBX), a community-based organization introduce local residents about the options that design can provide to improve the environment, and to educate the architecture and engineering student participants about how they can use their knowledge to the benefit of the community.

3.5 Economies of Waste

Description

The neighborhood is key to understanding how cities can respond and adapt to new demands related to **urban ecology, public health and economic development**. Through these elements, the studio explored **design proposals** for the neighborhood of East Harlem

Green Tech Innovation

Collaboration

GSAPP
SEAS
Manhattan Borough President' Office
Go Green East Harlem Initiative

- WATER**

This studio course explored a series of rain-water harvesting techniques in urban environments within dense urban fabrics, to reduce dramatically the overconsumption of water.
- ENERGY**

The research evaluated the option of integration of Waste-to-Energy strategies in urban environments encompassing micro-scale design proposals that utilize diverse techniques such as composting, recycling and composting of organic material.
- URBANIZATION**

20% of the East Harlem residents live in Public Housing dominated by "tower in the park" typology which is frequently stigmatized for its relationship to poverty, urban decay and crime. The research questioned this presumption, considering Public Housing as an asset that can be developed as a vital piece of infrastructure for a healthy city.
- HAZARD & RISK**
- GLOBAL HEALTH**

Fundamental to this research was exploration of environmental strategies related to local health problems, primarily childhood obesity and asthma. In this arena or childhood disease, East Harlem shares much with many other poor urban communities throughout the world.
- POVERTY**

East Harlem is one of the poorest areas in NYC and the Nation. The design interventions explored creation of job opportunities for local residents in large part related to green development practices.
- FOOD ECOLOGY & NUTRITION**

The research addressed the issue of food production in urban areas beyond the high-tech "vertical farm" model, suggesting alternative modular urban farming systems that can build social and economic equity within communities.
- ECOSYSTEMS**

Analysis of existing urban ecological systems (water, air, climate, vegetation, and garbage/sewage) led to the development of design proposals that foster positive environmental conditions.
- CLIMATE & SOCIETY**

The effects of Urban Heat Island were central to design proposals that seek to improve urban microclimatic conditions.
- EDUCATION**

Working in collaboration with the Manhattan Borough President's Office (MBPO) and the Go Green East Harlem Initiative, the studio seeks to educate East Harlem and City officials about the options that design can provide to ensure a sustainable future for the community, and to educate engineering and architecture students about application of their knowledge for the public good.

3.6 Economies of Waste

Micro-Infrastructure Innovation

Description

The Ultra-Ex (Urban Long Term Research Areas- Exploratory Research) pursues developing understanding of “the dynamic interactions between **people and natural ecosystems in urban settings**”, toward the goal of improving eco-system functionality in urban environments.

Collaboration

Emphasis was placed on developing strategies for productive use of organic waste for food production through innovation in urban composting techniques.

Inefficient waste management systems put urban regional ecosystems at risk. This study points to the need to develop sustainable and equitable strategies for protecting large-scale urban ecosystems through scaling down to community level solutions.

This studio worked in collaboration with the Columbia University Office of Environmental Stewardship to develop demonstration projects toward increasing public awareness of the efficiencies of micro-scale urban infrastructure.

4.1 Economies of Water

Description

At the request of the Korean Land Institute, the UDL is in the process of **coordinating a study of a new town development for Dongtan, South Korea.**

Green Infrastructure

Collaboration

University of Korea
Gyeonggi-do Province

Support

Korea Planners Association
Government of South Korea

- 

WATER

South Korea is currently the world's 5th largest importer of potable water. With a low annual rainfall, a small percentage of the surface water is collected and treated for consumption use. Municipal water filtration infrastructure is outdated. Water will be an increasingly valuable commodity in the years to come.
- 

ENERGY

Rapid new development in housing, workplaces and shopping centers is producing a record demand for energy. As national development moves forward, a focus on alternative energy strategies must be developed to reduce South Korean oil dependency.
- 

URBANIZATION

The growth of the City of Seoul is planned as regional center nodes such as a Seoul mega city region connected by advanced road, mass transportation and telecommunications infrastructure.
- 

HAZARD & RISK
- 

GLOBAL HEALTH
- 

POVERTY
- 

FOOD ECOLOGY & NUTRITION

With the rapid growth of Seoul, supportive systems such as food and water must service a densifying population. Agriculture is a vital component of urban living, with a symbiosis between urban, suburban and the rural regions need to coexist. Importation of food from outside the country will be a costly option in years to come.
- 

ECOSYSTEMS
- 

CLIMATE & SOCIETY

To address the environmental concerns regarding Climate Change, Global Warming and Carbon Emissions, a new typology of urban development must foster ecological living systems to enhance the vegetative characteristics of cities. Incorporating green roofs and walls, water retention ponds, and green public spaces are the first steps to develop livable neighborhoods for the 21st century.

EDUCATION

5.1 Economies of Energy

Upper Delaware: Water/Energy Conflicts

Upper Delaware
Gas Drilling
 Impact Study

GSAPP OSU UDPC
 Columbia Environmental
 Law Clinic

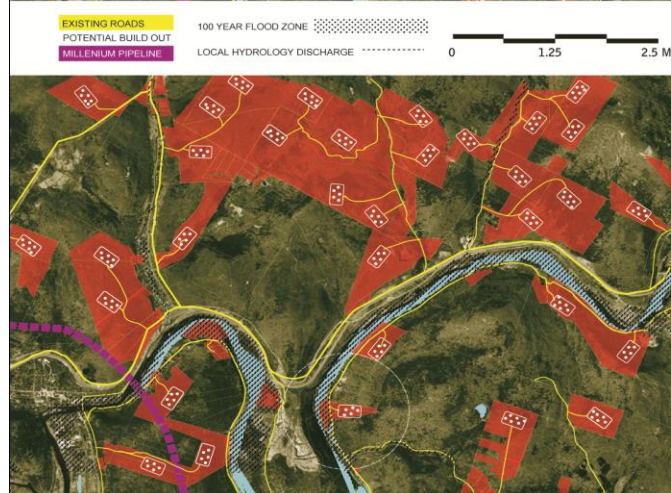

Description

This student research looks at the **impacts of gas drilling** as it effects the rural landscape, subsurface geology and health impacts to residents and the community at large.

Collaboration

- GSAPP
- Columbia Environmental Law Clinic
- Support**
- Open Space Institute
- Upper Delaware Preservation Coalition
- Norcross Foundation

- WATER**
This study analyses the potential impacts of natural gas extraction from the Marcellus Shale deposits on the Upper Delaware watershed. With the potential for thousands of wells, the extraction process will involve significant environmental impacts, most basically on water-related factors. Gas drilling acts as a big stressor on the water sources and pose a risk of polluting the aquifer.
- ENERGY**
Natural energy resources are in increasingly high demand. The Upper Delaware is highly sought after for its natural gas resources below the surface. Although natural gas is abundant, the extraction process has significant environmental impacts. This study will balance these competing interests in determining the impacts of gas drilling.
- URBANIZATION**
The hydro-fracking process deployed for Marcellus Shale has a history of negative environmental impacts including the health of nearby residents. Health disorders that can result from living near gas drilling include nausea, headaches, sleep dysfunction, and learning disabilities. This research study integrates these impacts into locational analysis.
- HAZARD & RISK**
Leasing by individual property owners for gas drilling opens up new economic possibilities for residents with limited income. While subsidies to allow drilling may provide new means of income for property owners, but also bring environmental risk and depreciation in property value.
- GLOBAL HEALTH**
Large-scale gas drilling effectively transforms an agrarian region into an industrial environment, entailing massive changes in the ecosystem, involving both air, soil, and water.
- POVERTY**
The uncertainties of climate change relative to gas drilling and distribution within a fragile physical and social environment are integral to this study.
- FOOD ECOLOGY & NUTRITION**
The project runs as a QUES program, meaning participation of students from Law and Architecture to educate the general public.
- ECOSYSTEMS**
- CLIMATE & SOCIETY**
- EDUCATION**

6.1 The Health Equation

Description

Bring together experts in **public health, medicine, business, economics** and design to apply a “big-picture” perspective while identifying and analyzing issues on a **variety of scales**

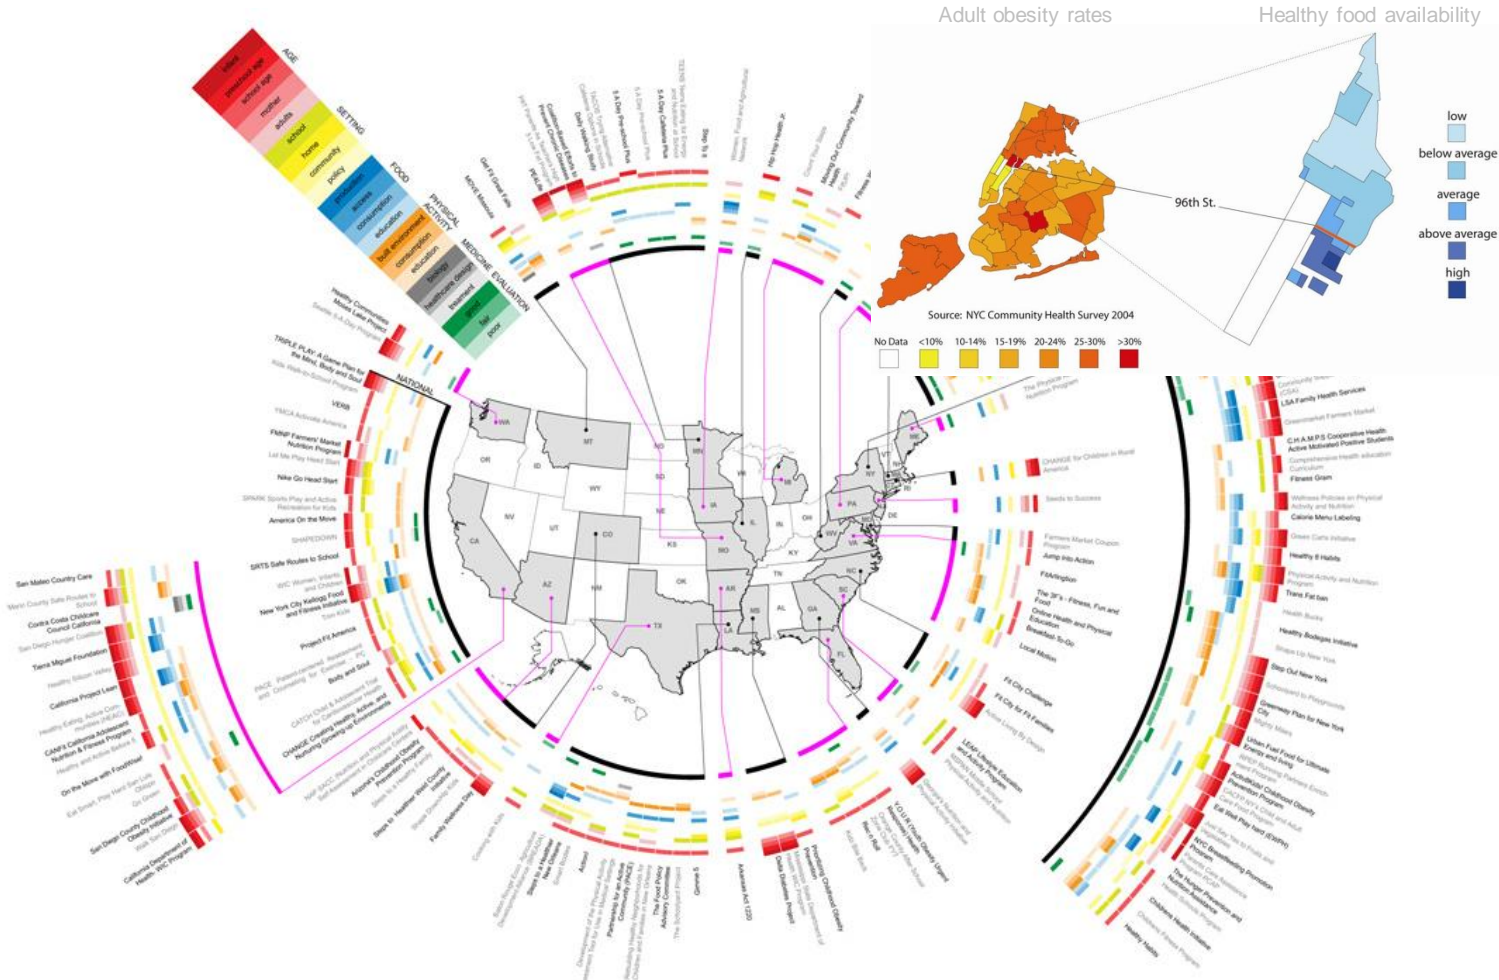

National Food System

Curbing Childhood Obesity
 Searching for Comprehensive Solutions
 United Health Foundation, MIT Collaborative Initiative

- WATER**
 The childhood obesity project has focused on analyzing the industrial food system, which is responsible for a great deal of water pollution. The UDL is engaged in researching and proposing alternatives to the current food system that would significantly reduce fertilizer and pesticide runoff.
- ENERGY**
 This project researches the potential for creating alternative food production systems and alternative food transportation systems, which would use less energy.
- URBANIZATION**
 The built environment and how it affects residents' eating and physical activity habits, integral to the study is initiation of community-based healthy planning projects in several diverse locations across the country in order to increase access to fresh foods, limit the proliferation of high-calorie low-nutrient foods, and maximize opportunities for physical activity.
- HAZARD & RISK**
 Because of the industrial food system's large scale and centralization, dysfunctions in production or distribution can impact thousands of people.
- GLOBAL HEALTH**
 The worldwide food commodities market encourages small farmers in developing countries to grow food for export rather than for local consumption, leaving many areas vulnerable to fluctuating commodity prices, and contributing to poverty and poor nutrition.
- POVERTY**
 The study points to poverty as a factor in obesity and to obesity as a cause of poverty (because of related illnesses) can inhibit workplace productivity and result in high medical costs.
- FOOD ECOLOGY & NUTRITION**
 The childhood obesity project proposes to curb obesity largely by designing neighborhoods and food systems to increase consumption of fruits, vegetables, and whole grains, ensuring good nutrition and improved health.
- ECOSYSTEMS**
 The research points to the industrial food system as one major reason why crop monoculture has proliferated globally.
- CLIMATE & SOCIETY**
 The research emphasizes forging links between food production and the environmental movement. The industrial food system is a major generator of greenhouse gases.
- EDUCATION**
 An important aspect of curbing childhood obesity involves child education about food, physical activity, and health. The research analyzed innovative programs that can serve as models for integrating cooking and nutrition education into schools.

6.2 The HEALTH Equation

Description

An analysis of New York City's food origins, distribution systems, and consumption patterns

Regional Food System

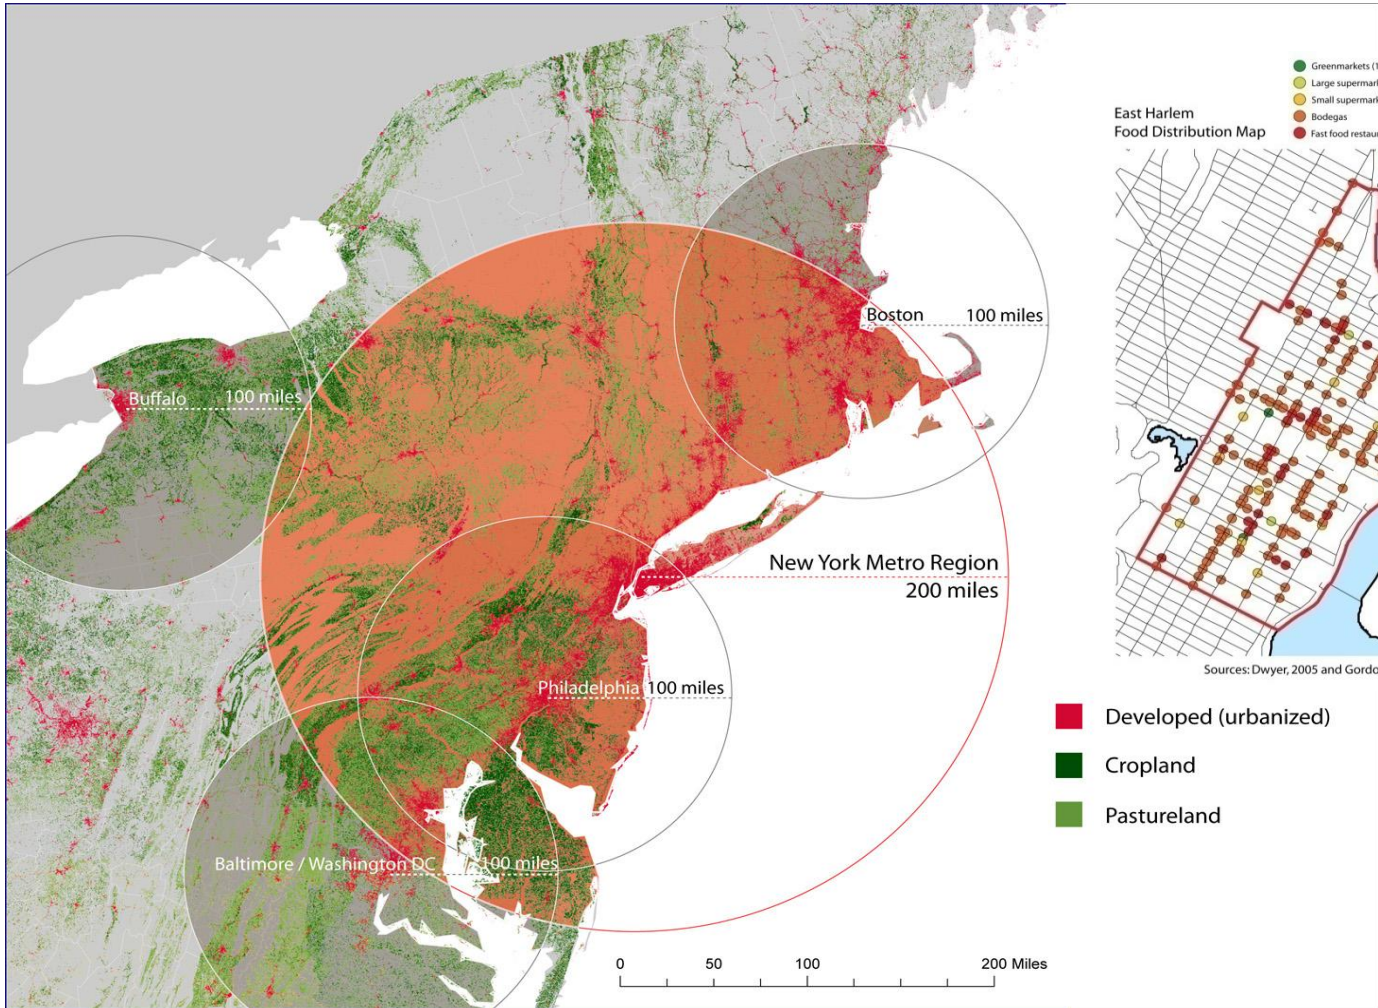

Collaboration

Manhattan Borough President's Office
 Stone Barns Center for Food and Agriculture

Potential Support

USDA
 NYSERDA

- WATER**
This research points to the impacts of the industrial food system on the environment including water pollution. The Food Summit discussed the importance of researching alternatives to the current food system to significantly reduce fertilizer and pesticide runoff.
- ENERGY**
Reducing energy consumption is an essential component of creating alternative food systems. Although crops may be grown with only soil, sunlight, and water, our current industrial food system unnecessarily uses petroleum-based fertilizers and pesticides to support unsustainable monocultures.
- URBANIZATION**
The study points to an important aspect of food policy in New York City related to its effect on the built environment and its relevance to food availability and physical activity. Innovative physical planning can ensure that fresh food is available in all neighborhoods and high-calorie low nutrient foods are limited.
- HAZARD & RISK**
The industrial food system has inherent weaknesses that leave it vulnerable to accidental contamination, environmental disasters, or terrorism. These research concerns have particular relevance to New York City, and strategic planning for a more secure alternative food system.
- GLOBAL HEALTH**
Obesity, heart disease, and diabetes are often correlated with poverty, particularly in low-income communities. However, obesity can also be considered a cause of poverty because it (and related illnesses) can inhibit workplace productivity and result in high medical bills.
- POVERTY**
By designing neighborhoods and food systems to increase the public's consumption of fruits, vegetables, and whole grains, New York can move towards ensuring improved nutrition and improved health of its residents.
- FOOD ECOLOGY & NUTRITION**
The industrial food system is one major reason why crop monocultures have proliferated across the world. Development of alternative agriculture systems could promote greater ecological stability.
- ECOSYSTEMS**
Because New York City is particularly vulnerable to the effects of climate change, this project integrates this added local political incentive to reduce greenhouse gas emissions providing a model for cities across the nation. The current industrial food system generates a great deal of greenhouse gases, but a localized food system based on sustainable agriculture practices would generate much less. The research points to urban agriculture as an ideal target for the environmental movement.
- CLIMATE & SOCIETY**
- EDUCATION**

East Harlem Food Distribution Map

- Greenmarkets (1-2 x per week)
- Large supermarkets (>10,000 sq. ft.)
- Small supermarkets (4,000-10,000 sq. ft.)
- Bodegas
- Fast food restaurants

- Developed (urbanized)
- Cropland
- Pastureland

6.3 The HEALTH Equation

New York Regional Foodshed

Description

In modern assessments of urban issues, understanding a city's relationship with its supporting communities - those which provide workers, energy, water, food, supplies, and waste disposal- is a necessary precondition for designing sustainable urban systems. Perhaps nowhere is this more apparent than in the relationship of farms to their markets.

6.4 The HEALTH Equation

Urban Food Deserts

Description

Bring together experts in **public health, medicine, business, economics** and design to apply a “big-picture” perspective while identifying and analyzing issues on a **variety of scales**

Collaboration

Collaborative Initiatives at MIT
Support
 United Health Foundation

- WATER**

This studio course explored a series of rain-water harvesting techniques suitable for application within dense urban fabrics, to reduce dramatically the overconsumption of water.
- ENERGY**

The research evaluated the option of integration of Waste-to-Energy strategies in urban environments encompassing micro-scale design proposals that utilize diverse techniques such as composting, recycling and combusting of organic material.
- URBANIZATION**

20% of the East Harlem residents live in Public Housing dominated by “tower in the park” typology which is frequently stigmatized for its relationship to poverty, urban decay and crime. The research questioned this presumption, considering Public Housing as an asset that can be developed as a vital piece of infrastructure for a healthy city.
- HAZARD & RISK**
- GLOBAL HEALTH**

Fundamental to this research was exploration of environmental strategies related to local health problems, primarily childhood obesity and asthma. In this arena or childhood disease, East Harlem shares much with many other poor urban communities throughout the world.
- POVERTY**

East Harlem is one of the poorest areas in NYC and the Nation. The design interventions explored creation of job opportunities for local residents in large part related to green development practices.
- FOOD ECOLOGY & NUTRITION**

The research addressed the issue of food production in urban areas beyond the high-tech “vertical farm” model, suggesting alternative modular urban farming systems that can build social and economic equity within communities.
- ECOSYSTEMS**

Analysis of existing urban ecological systems (water, air, climate, vegetation, and garbage/sewage) led to the development of design proposals that foster positive environmental conditions.
- CLIMATE & SOCIETY**

The effects of Urban Heat Island were central to design proposals that seek to improve urban microclimatic conditions.
- EDUCATION**

Working in collaboration with the Manhattan Borough President’s Office (MBPO) and the Go Green East Harlem Initiative, we strive to educate East Harlem and City officials about the options that design can provide to ensure a sustainable future for the community, and to educate engineering and architecture students about application of their knowledge for the public good.
