### **Job Market Paper:** “Politics and Public Goods in Developing Countries: Evidence from India”

Abstract: Using an instrument to generate random variation in the identity of the party representing a parliamentary constituency in the national government of India, I show that party preferences have substantial effects on the composition of public goods. Where the party exogenously assigned to a constituency belongs to the pro-poor party, access to drinking water and primary education increase, while electrification, paved roads, and telephone coverage decline. These results are consistent with the preferences of the party’s core supporters. In contrast to the large and significant results obtained through the IV identification, the use of an RD design yields small and generally insignificant results. The latter finding is consistent with electoral models predicting policy convergence of rival parties in pursuit of the median voter.
